Primitive Recursive Functions (3)

Theory of Computation

Prof. Michael Mascagni

Florida State University Department of Computer Science Preliminaries (1) Programs and Computable Functions (2) Primitive Recursive Functions (3)

Functions (1.2)

One-One Functions

- ► A function is *one-one* if, for all x, y in the domain of f, f(x) = f(y) implies x = y.
- That is, if $x \neq y$, then $f(x) \neq f(y)$.
- Function $f(n) = n^2$ is one-one.
- Function $u_1^2(x_1, x_2) = x_1$ is not one-one as, for example, both $u_1^2(0,0)$ and $u_1^2(0,1)$ map to 0.

Preliminaries (1) ograms and Computable Functions (2) Primitive Recursive Functions (3)

Functions (1.2)

Onto Functions

- If the range of f is the set S, then we say f is an onto function with respect to S, or simply that f is onto S.
- ▶ Function $f(n) = n^2$ is onto the set of perfect squares $\{n^2 \mid n \in N\}$, but is not onto N.
- Let S₁ × S₂ be domain of function u²₁(x₁, x₂) = x₁, then function u²₁(x₁, x₂) is onto S₁.

Preliminaries (1) Programs and Computable Functions (2) Primitive Recursive Functions (3)

Computable Functions (2.4)

Programs Accepting Any Number of Inputs

- We permit each program to be used with any number of inputs.
- ► If the program has *n* input variables, but only *m* < *n* are specified, the remaining *n* − *m* input variables are assigned the value 0 and the computation proceeds.
- On the other hand, if m > n values are specified, then the extra input values are ignored.

Preliminaries (1) Programs and Computable Functions (2) Primitive Recursive Functions (3)

Computable Functions (2.4)

Programs Accepting Any Number of Inputs, Examples

- Consider the following program \mathscr{P} that computes $x_1 + x_2$,
 - $\begin{bmatrix} Z \leftarrow X_2 \\ \text{IF } Z \neq 0 \text{ GOTO } A \\ \text{GOTO } E \end{bmatrix}$

 $Y \leftarrow X_1$

$$\begin{bmatrix} A \end{bmatrix} \quad \begin{array}{c} Z \leftarrow Z - 1 \\ Y \leftarrow Y + 1 \\ \text{GOTO } B \end{array}$$

We have

$$\begin{split} \Psi^{(1)}_{\mathscr{P}}(r_1) &= r_1 + 0 = r_1 \\ \Psi^{(3)}_{\mathscr{P}}(r_1, r_2, r_3) &= r_1 + r_2 \end{split}$$

Preliminaries (1) Programs and Computable Functions (2) Primitive Recursive Functions (3) Primitive Recursive Function

Initial Functions

The following functions are called *initial functions*:

$$s(x) = x + 1,$$

 $n(x) = 0,$
 $u_i^n(x_1,...,x_n) = x_i, \quad 1 \le i \le n.$

Note: Function u_i^n is called the *projection function*. For example, $u_3^4(x_1, x_2, x_3, x_4) = x_3$.

Primitive Recursive Functions (3)

PRC Classes (3.3) Some Primitive Recursive Functions/Predicates (3.4, 3.5) Iterated Operations and Bounded Quantifiers (3.6) Minimalization (3.7) Pairing Functions and Gödel Numbers (3.9)

Primitive Recursively Closed (PRC)

A class of total functions % is called a PRC class if

- ▶ the initial functions belong to ,
- ► a function obtained from functions belonging to *C* by either composition or recursion also belongs to *C*.

PRC Classes (3.3) Preliminaries (1) Programs and Computable Functions (2) Primitive Recursive Functions (3) Primitive Recursive Functions (3) Primitive Recursive Functions (3) Primitive Recursive Functions (3, 9)

Computable Functions are Primitive Recursively Closed

Theorem 3.1. The class of computable functions is a PRC class.

Proof. We have shown computable functions are closed under composition and recursion (Theorem 1.1 & 2.2). We need only verify the initial functions are computable. They are computed by the following programs.

$$|s(x) = x+1| Y \leftarrow X+1;$$

the empty program;

 $u_i^n(x_1,\ldots,x_n) \mid Y \leftarrow X_i.$

n(x)

Preliminaries (1)

Programs and Computable Functions (2)

Primitive Recursive Functions (3)

PRC Classes (3.3) Some Primitive Recursive Functions/Predicates (3.4, 3.5) Iterated Operations and Bounded Quantifiers (3.6) Minimalization (3.7) Pairing Functions and Gödel Numbers (3.9)

Primitive Recursive Functions

A function is called *primitive recursive* if it can be obtained from the initial functions by a finite number of applications of composition and recursion.

Note that, by the above definition and the definition of Primitive Recursively Closed (PRC), it follows that:

Corollary 3.2. The class of primitive recursive functions is a PRC class.

PRC Classes (3.3) Preliminaries (1) ms and Computable Functions (2) Primitive Recursive Functions (3) Primitive Recursive Functions (3.7) Pairing Functions and Gödel Numbers (3.9)

Primitive Recursive Functions & PRC Classes

Theorem 3.3. A function is primitive recursive if and only if it belongs to every PRC class.

Proof. (\Leftarrow) If a function belongs to every PRC class, then by Corollary 3.2, it belongs to the class of primitive recursive functions.

(⇒) If f is primitive recursive, then there is a list of functions f_1, f_2, \ldots, f_n such that $f_n = f$ and for each $f_i, 1 \le i < n$, either

- *f_i* is an initial function, or
- *f_i* can be obtained from the preceding functions in the list by composition or recursion.

However, the initial functions belong to any PRC class \mathscr{C} . Furthermore, all functions obtained from functions in \mathscr{C} by composition or recursion also belong to \mathscr{C} . It follows that each function $f_1, f_2, \ldots, f_n = f$ in the above list is in \mathscr{C} . PRC Classes (3.3) Preliminaries (1) Programs and Computable Functions (2) Primitive Recursive Functions and Bounded Quantifiers (3.6) Primitive Recursive Functions (3.7) Primitive Recursive Functions (3.9)

Primitive Recursive Functions Are Computable

Corollary 3.4. Every primitive recursive function is computable. *Proof.* By Theorem 3.4, every primitive recursive function belongs to the PRC class of computable functions so is computable.

- ► If a function f is shown to be primitive recursive, by the above Corollary, f can be expressed as a program in language S.
- Not only we know there is program in S for f, by Theorem 3.1 (1.1 & 2.2), we also know how to write this program.

► Furthermore, the program so written will always terminate. However, if a function f is computable (that is, it is total and expressible in 𝒴), it is not necessarily that f is primitive recursive. (A counter example will be shown later in this course.) Preliminaries (1) Programs and Computable Functions (2) Primitive Recursive Functions (3) Primitive Recursive Functions (3) Primitive Recursive Functions (3,7) Pairing Functions and Gödel Numbers (3,9)

Function f(x, y) = x + y Is Primitive Recursive

Function f can be defined by the recursion equations:

$$f(x,0) = x,$$

 $f(x,y+1) = f(x,y) + 1.$

The above can be rewritten as

$$f(x,0) = u_1^1(x), f(x,y+1) = g(y, f(x,y), x),$$

where

$$g(x_1, x_2, x_3) = s(u_2^3(x_1, x_2, x_3)).$$

Preliminaries (1) Programs and Computable Functions (2) Primitive Recursive Functions (3) Primitive Recursive Function

Function $h(x, y) = x \cdot y$ Is Primitive Recursive

Function h can be defined by the recursion equations:

$$h(x,0) = 0,$$

 $h(x,y+1) = h(x,y) + x.$

The above can be rewritten as

$$h(x,0) = n(x),$$

 $h(x,y+1) = g(y,h(x,y),x),$

where

$$g(x_1, x_2, x_3) = f(u_2^3(x_1, x_2, x_3), u_3^3(x_1, x_2, x_3)),$$

$$f(x, y) = x + y.$$

PRC Classes (3.3) Preliminaries (1) Programs and Computable Functions (2) Primitive Recursive Functions (3) Primitive

Function h(x) = x! Is Primitive Recursive

Function h(x) can be defined by

$$h(0) = 1,$$

 $h(t+1) = g(t, h(t)),$

where

$$g(x_1,x_2)=s(x_1)\cdot x_2.$$

Note that g is primitive recursive because

$$g(x_1, x_2) = s(u_1^2(x_1, x_2)) \cdot u_2^2(x_1, x_2).$$

Preliminaries (1) Programs and Computable Functions (2) Primitive Recursive Functions (3) Minimalization (3.7) Pairing Functions and Gödel Numbers (3.9)

Function $power(x, y) = x^y$ Is Primitive Recursive

Function *power* can be defined by

$$power(x, 0) = 1,$$

$$power(x, y + 1) = power(x, y) \cdot x.$$

Note that these equations assign the value 1 to the "indeterminate" 0^0 .

The above definition can be further rewritten into

Preliminaries (1) Programs and Computable Functions (2) Primitive Recursive Functions (3) Primitive Recursive Function

The Predecessor Function Is Primitive Recursive

The predecessor function pred(x) is defined as follows:

$$pred(x) = \begin{cases} x - 1 & \text{if } x \neq 0 \\ 0 & \text{if } x = 0. \end{cases}$$

Note that function *pred* corresponds to the instruction $X \leftarrow X - 1$ in programming language \mathscr{S} .

The above definition can be further rewritten into

PRC Classes (3.3) Preliminaries (1) Programs and Computable Functions (2) Primitive Recursive Functions (3) Primitive Recursive Functions (3) Primitive Recursive Functions (3) Primitive Recursive Functions (3) Primitive Recursive Functions (3, 9)

Function $\dot{x-y}$ Is Primitive Recursive

Function $\dot{x-y}$ is defined as follows:

$$\dot{x-y} = \begin{cases} x-y & \text{if } x \ge y \\ 0 & \text{if } x < y. \end{cases}$$

Note that function x - y is different from function x - y, which is undefined if x < y. In particular, x - y is total while x - y is not.

Function $\dot{x-y}$ is primitive recursive because

$$\begin{array}{rcl} x-0 & = & x, \\ \dot{x-(t+1)} & = & \textit{pred}(x-t). \end{array}$$

The above definition can be further rewritten into

PRC Classes (3.3) Preliminaries (1) ms and Computable Functions (2) Primitive Recursive Functions (3) Primitive Recursive Functions (3.7) Pairing Functions and Gödel Numbers (3.9)

Function |x - y| Is Primitive Recursive

Function |x - y| can be defined as follows:

$$|x-y| = (\dot{x-y}) + (\dot{y-x})$$

It is primitive recursive because the above definition can be further rewritten into

Preliminaries (1)

Programs and Computable Functions (2)

Primitive Recursive Functions (3)

PRC Classes (3.3) Some Primitive Recursive Functions/Predicates (3.4, 3.5) Iterated Operations and Bounded Quantifiers (3.6) Minimalization (3.7) Pairing Functions and Gödel Numbers (3.9)

Is $x \leq y$ Primitive Recursive?

It is primitive recursive because $x \le y = \alpha(x - y)$.

Programs and Computable Functions (2) Primitive Recursive Functions (3.7) Primitive Recursive Functions (3.7) Primitive Recursive Functions (3.7) Pairing Functions and Gödel Numbers (3.9)

Logic Connectives Are Primitive Recursively Closed

Theorem 5.1. Let \mathscr{C} be a PRC class. If P, Q are predicates that belong to \mathscr{C} , then so are $\sim P$, $P \lor Q$, and P&Q.

Proof. We define $\sim P$, $P \lor Q$, and P & Q as follows:

$$\sim P = \alpha(P)$$

$$P \& Q = P \cdot Q$$

$$P \lor Q = \sim (\sim P \& \sim Q)$$

We conclude that $\sim P$, $P \lor Q$, and P & Q all belong to \mathscr{C} .

Prec Classes (3.3) Preliminaries (1) Programs and Computable Functions (2) Primitive Recursive Functions (3) Primitive Recursive Functions (3)

Logic Connectives Are Primitive Recursive and Computable

Corollary 5.2. If *P*, *Q* are primitive recursive predicates, then so are $\sim P$, $P \lor Q$, and P & Q.

Corollary 5.3. If *P*, *Q* are computable predicates, then so are $\sim P$, $P \lor Q$, and P&Q.

Programs and Computable Functions (2)
Primitive Recursive Functions (3)
Primitive Recursive Functions (4)
Primitive Recursiv

Is x < y Primitive Recursive?

It is primitive recursive because

 $x < y \Leftrightarrow \sim (y \leq x).$

PRC Classes (3.3) Preliminaries (1) Programs and Computable Functions (2) Primitive Recursive Functions (3) Primitive Recursive Functions (3) Primitive Recursive Functions (3.7) Pairing Functions and Gödel Numbers (3.9)

Definition by Cases

Theorem 5.4. Let \mathscr{C} be a PRC class. Let functions g, h and predicate P belong to \mathscr{C} . Let function

$$f(x_1,\ldots,x_n) = \begin{cases} g(x_1,\ldots,x_n) & \text{if } P(x_1,\ldots,x_n) \\ h(x_1,\ldots,x_n) & \text{otherwise.} \end{cases}$$

Then f belongs to \mathscr{C} .

Proof. Function f belongs to \mathscr{C} because

$$f(x_1,\ldots,x_n) = g(x_1,\ldots,x_n) \cdot P(x_1,\ldots,x_n) + h(x_1,\ldots,x_n) \cdot \alpha(P(x_1,\ldots,x_n)).$$

Preliminaries (1) Programs and Computable Functions (2) Primitive Recursive Functions (3) Primitive Recursive Functions (3) Primitive Recursive Functions (3) Primitive Recursive Functions (3) Primitive Recursive Functions (3.7) Pairing Functions and Gödel Numbers (3.9)

Definition by Cases, More

Corollary 5.5. Let \mathscr{C} be a PRC class. Let n-ary functions g_1, \ldots, g_m, h and predicates P_1, \ldots, P_m belong to \mathscr{C} , and let

$$P_i(x_1,\ldots,x_n) \& P_j(x_1,\ldots,x_n) = 0$$

for all $1 \le i < j \le m$ and all x_1, \ldots, x_n . If

$$f(x_1,\ldots,x_n) = \begin{cases} g_1(x_1,\ldots,x_n) & \text{if } P_1(x_1,\ldots,x_n) \\ \vdots & \vdots \\ g_m(x_1,\ldots,x_n) & \text{if } P_m(x_1,\ldots,x_n) \\ h(x_1,\ldots,x_n) & \text{otherwise.} \end{cases}$$

then f also belongs to \mathscr{C} .

Proof. Proved by a mathematical induction on m.

PRC Classes (3.3) Preliminaries (1) Programs and Computable Functions (2) Primitive Recursive Functions (3) Primitive

Iterated Operations

Theorem 6.1. Let \mathscr{C} be a PRC class. If function $f(t, x_1, \ldots, x_n)$ belongs to \mathscr{C} , then so do the functions g and h

$$g(y, x_1, ..., x_n) = \sum_{t=0}^{y} f(t, x_1, ..., x_n)$$
$$h(y, x_1, ..., x_n) = \prod_{t=0}^{y} f(t, x_1, ..., x_n)$$

Proof. Functions g and h each can be recursively defined as

$$g(0, x_1, \dots, x_n) = f(0, x_1, \dots, x_n),$$

$$g(t+1, x_1, \dots, x_n) = g(t, x_1, \dots, x_n) + f(t+1, x_1, \dots, x_n),$$

$$h(0, x_1, \dots, x_n) = f(0, x_1, \dots, x_n),$$

$$h(t+1, x_1, \dots, x_n) = h(t, x_1, \dots, x_n) \cdot f(t+1, x_1, \dots, x_n).$$

Preliminaries (1) Programs and Computable Functions (2) Primitive Recursive Functions (3) Primitive Recursive Functions (3) Primitive Recursive and Gödel Numbers (3.9)

Iterated Operations, More

Corollary 6.2. Let \mathscr{C} be a PRC class. If function $f(t, x_1, \ldots, x_n)$ belongs to \mathscr{C} , then so do the functions

$$g(y, x_1, \ldots, x_n) = \sum_{t=1}^{y} f(t, x_1, \ldots, x_n)$$

and

$$h(y, x_1, \ldots, x_n) = \prod_{t=1}^{y} f(t, x_1, \ldots, x_n).$$

In the above, we assume that

$$g(0, x_1, \dots, x_n) = 0,$$

 $h(0, x_1, \dots, x_n) = 1.$

PRC Classes (3.3) Preliminaries (1) Programs and Computable Functions (2) Primitive Recursive Functions (3) Primitive Recursive Functions (3) Primitive Recursive Functions (3) Primitive Recursive Functions (3.7) Pairing Functions and Gödel Numbers (3.9)

Bounded Quantifiers

Theorem 6.3. If predicate $P(t, x_1, ..., x_n)$ belongs to some PRC class \mathscr{C} , then so do the predicates

 $(\forall t)_{\leq y} P(t, x_1, \ldots, x_n)$

and

$$(\exists t)_{\leq y} P(t, x_1, \ldots, x_n)$$

Proof. We need only observe that

$$(\forall t)_{\leq y} P(t, x_1, \ldots, x_n) \Leftrightarrow \prod_{t=0}^{y} P(t, x_1, \ldots, x_n) = 1$$

and

$$(\exists t)_{\leq y} P(t, x_1, \ldots, x_n) \Leftrightarrow \sum_{t=0}^{y} P(t, x_1, \ldots, x_n) \neq 0$$

Preliminaries (1) Programs and Computable Functions (2) Primitive Recursive Functions (3) Primitive Recursive Functions (3)

Bounded Quantifiers, More

Note that

$$(\forall t)_{\leq y} P(t, x_1, \ldots, x_n) \Leftrightarrow (\forall t)_{\leq y} [t = y \lor P(t, x_1, \ldots, x_n)],$$

and

$$(\exists t)_{\leq y} P(t, x_1, \ldots, x_n) \Leftrightarrow (\exists t)_{\leq y} [t \neq y \& P(t, x_1, \ldots, x_n)].$$

Therefore, both the quantifiers $(\forall t)_{<y}$ and $(\exists t)_{<y}$ are primitive recursively closed.

Prec Classes (3.3) Preliminaries (1) Programs and Computable Functions (2) Primitive Recursive Functions (3) Primitive Recursive Functions (3)

y|x Is Primitive Recursive

The "y is a divisor of x" predicate y|x is primitive recursive because

$$y|x \Leftrightarrow (\exists t)_{\leq x}(y \cdot t = x).$$

Preliminaries (1)

Programs and Computable Functions (2)

Primitive Recursive Functions (3)

PRC Classes (3.3) Some Primitive Recursive Functions/Predicates (3.4, 3.5) Iterated Operations and Bounded Quantifiers (3.6) Minimalization (3.7) Pairing Functions and Gödel Numbers (3.9)

Prime(x) Is Primitive Recursive

The "x is a prime" predicate Prime(x) is primitive recursive because

 $\mathsf{Prime}(x) \ \Leftrightarrow \ x > 1 \ \& \ (\forall t)_{\leq x}[t = 1 \ \lor \ t = x \ \lor \ \sim (t|x)].$

Preliminaries (1) Programs and Computable Functions (2) Primitive Recursive Functions (3) Primitive Recursive Functions (3)

Bounded Minimalization

What does the following function g do?

$$g(y, x_1, \ldots, x_n) = \sum_{u=0}^{y} \prod_{t=0}^{u} \alpha(P(t, x_1, \ldots, x_n))$$

It computes the least value $t \leq y$ for which $P(t, x_1, ..., x_n)$ is true! To see why, let $t_0 \leq y$ such that

$$P(t, x_1, \ldots, x_n) = 0$$
 for all $t < t_0$,

but

$$P(t_0, x_1, \ldots, x_n) = 1$$

Then

$$\prod_{t=0}^{u} \alpha(P(t, x_1, \ldots, x_n)) = \begin{cases} 1 & \text{if } u < t_0, \\ 0 & \text{if } u \ge t_0. \end{cases}$$

Hence $g(y, x_1, ..., x_n) = \sum_{u < t_0} 1 = t_0$.

PRC Classes (3.3) Preliminaries (1) ms and Computable Functions (2) Primitive Recursive Functions (3) Primitive Recursive Functions (3.6) Minimalization (3.7) Pairing Functions and Gödel Numbers (3.9)

Bounded Minimalization, Continued

Define

$$\min_{t \leq y} P(t, x_1, \dots, x_n) = \begin{cases} g(y, x_1, \dots, x_n) & \text{if } (\exists t)_{\leq y} P(t, x_1, \dots, x_n), \\ 0 & \text{otherwise.} \end{cases}$$

Thus, $\min_{t \le y} P(t, x_1, \ldots, x_n)$, is the least value $t \le y$ for which $P(t, x_1, \ldots, x_n)$ is true, if such exists; otherwise it assumes the (default) value 0.

Theorem 7.1. $\min_{t \leq y} P(t, x_1, \dots, x_n)$ is in PRC class \mathscr{C} if $P(t, x_1, \dots, x_n)$ is in \mathscr{C} .

Proof. By Theorems 5.4 and 6.3.

Preliminaries (1) Programs and Computable Functions (2) Primitive Recursive Functions (3) Primitive Recursive Functions (3)

$\lfloor x/y \rfloor$ Is Primitive Recursive

$$\lfloor x/y \rfloor$$
 is the "integer part" of the quotient x/y .

The equation

$$\lfloor x/y \rfloor = \min_{t \le x} [(t+1) \cdot y > x]$$

shows that $\lfloor x/y \rfloor$ is primitive recursive. Note that according to this definition, $\lfloor x/0 \rfloor = 0$.

PRC Classes (3.3) Preliminaries (1) Programs and Computable Functions (2) Primitive Recursive Functions (3) Primitive

R(x, y), The Remainder Function, Is Primitive Recursive

R(x, y) is the remainder when x is divided by y. As we can write

$$R(x,y) = x - (y \cdot \lfloor x/y \rfloor)$$

so that R(x, y) is primitive recursive. Note that R(x, 0) = x.

Preliminaries (1) Programs and Computable Functions (2) Primitive Recursive Functions (3) Primitive Recursive Functions (3) Primitive Recursive Functions (3) Primitive Recursive Functions (3) Minimalization (3.7) Pairing Functions and Gödel Numbers (3.9)

p_n , The *n*th Prime Number, Is Primitive Recursive

Note that $p_0 = 0$, $p_1 = 2$, $p_2 = 3$, $p_3 = 5$, etc.

 p_n is defined by the following recursive equations

$$p_0 = 0,$$

 $p_{n+1} = \min_{t \le p_n!+1} [Prime(t) \& t > p_n]$

so it is primitive recursive.

Note that $p_n! + 1$ is not divisible by any of the primes p_1, p_2, \ldots, p_n . So, either $p_n! + 1$ is itself a prime or it is divisible by a prime greater than p_n . In either case, there is a prime q such that $p_n < q \le p_n! + 1$.

PRC Classes (3.3) Preliminaries (1) Programs and Computable Functions (2) Primitive Recursive Functions (3) Primitive Recursive Functions (3) Primitive Recursive Functions (3) Primitive Recursive Functions (3.6) Minimalization (3.7) Pairing Functions and Gödel Numbers (3.9)

p_n Is Primitive Recursive, Continued

To be precise, we shall first define a primitive recursive function

$$h(y,z) = \min_{t \le z} [\mathsf{Prime}(t) \& t > y].$$

Then we define another primitive function

k(x) = h(x, x! + 1)

Finally, p_n is defined as

 $p_0 = 0,$ $p_{n+1} = k(p_n),$

and it is concluded that p_n is primitive recursive.

PRC Classes (3.3) Preliminaries (1) Some Primitive Recursive Functions/Predicates (3.4, 3.5) ograms and Computable Functions (2) Iterated Operations and Bounded Quantifiers (3.6) Primitive Recursive Functions (3) Minimalization (3.7) Pairing Functions and Gödel Numbers (3.9)

Minimalization, With No Bound

We write

$$\min_{y} P(x_1,\ldots,x_n,y)$$

for the least value of y for which the predicate P is true if there is one. If there is no value of y for which $P(x_1, ..., x_n, y)$ is true, then min_y $P(x_1, ..., x_n, y)$ is undefined.

Note that unbounded minimalization of a predicate can easily produce function which is not total. For example,

$$x - y = \min_{z} \left[y + z = x \right]$$

is undefined for x < y.

Preliminaries (1) Programs and Computable Functions (2) Primitive Recursive Functions (3) Primitive Recursive Function

Unbounded Minimalization is Partially Computable

Theorem 7.2. If $P(x_1, \ldots, x_n, y)$ is a computable predicate and if

$$g(x_1,\ldots,x_n)=\min_{y}P(x_1,\ldots,x_n,y)$$

then g is a partially computable function.

Proof. The following program computes g:

$$\begin{array}{ll} [A] & \mathsf{IF} \ P(X_1, \dots, X_n, Y) \ \mathsf{GOTO} \ \mathsf{E} \\ & Y \leftarrow Y + 1 \\ & \mathsf{GOTO} \ A \end{array}$$

PRC Classes (3.3) Preliminaries (1) Some Primitive Recursive Functions/Predicates (3.4, 3.5) Programs and Computable Functions (2) Iterated Operations and Bounded Quantifiers (3.6) Primitive Recursive Functions (3) Primitive Recursive Functions (3) Primitive Recursive Functions (3.7) Pairing Functions and Gödel Numbers (3.9)

Pairing Functions

- ► There is a one-one and onto function from N × N to N (with domain N × N and range N). This function is called a pairing function.
- That is, we can map a pair of numbers to a single number, and back, without losing information. Likewise, we can compute from any number a pair of numbers, and back, without missing anything.
- ► The primitive recursive function

$$\langle x, y \rangle = 2^{x}(2y+1)\dot{-}1$$

is a pairing function.

$$\blacktriangleright \langle 0, 0 \rangle = 0, \langle 1, 0 \rangle = 1, \langle 0, 1 \rangle = 2, \dots$$

Preliminaries (1) Programs and Computable Functions (2) Primitive Recursive Functions (3) Primitive Recursive Function

The Pairing Function $\langle x, y \rangle = 2^{x}(2y+1)\dot{-}1$

• Note that $2^{x}(2y+1) \neq 0$, so

 $\langle x,y\rangle+1=2^{x}(2y+1)$

- If z is any given number, then there is a unique solution x, y to the equation ⟨x, y⟩ = z.
- Namely, x is the largest number such that 2^x |(z + 1), and y is then the solution of the equation 2y + 1 = (z + 1)/2^x.
- The pairing function thus defines two functions l and r such that x = l(z) and y = r(z).

Preliminaries (1) Programs and Computable Functions (2) Primitive Recursive Functions (3) Primitive Recursive Functions (3)

The Pairing Function $\langle x, y \rangle = 2^{x}(2y+1)\dot{-}1$, Continued

If $\langle x, y \rangle = z$, then x, y < z + 1. Hence, $l(z) \le z$, and $r(z) \le z$.

We can write

$$l(z) = \min_{\substack{x \le z}} [(\exists y)_{\le z} (z = \langle x, y \rangle)],$$

$$r(z) = \min_{\substack{y \le z}} [(\exists x)_{\le z} (z = \langle x, y \rangle)],$$

so that I(z) and r(z) are primitive recursive functions.

Pairing Function Theorem

Theorem 8.1. The functions $\langle x, y \rangle$, I(z), and r(z) have the following properties:

- 1. they are primitive recursive;
- 2. $l(\langle x, y \rangle) = x$, $r(\langle x, y \rangle) = y$;
- 3. $\langle l(z), r(z) \rangle = z;$
- 4. $l(z), r(z) \le z$.

Gödel Number

We define the *Gödel Number* of the sequence (a_1, \ldots, a_n) to be the number

$$[a_1,\ldots,a_n]=\prod_{i=1}^n p_i^{a_i}$$

Thus, the the Gödel number of the sequence (3, 1, 5, 4, 6) is

$$[3, 1, 5, 4, 6] = 2^3 \cdot 3^1 \cdot 5^5 \cdot 7^4 \cdot 11^6$$

For each fixed *n*, the function $[a_1, \ldots, a_n]$ is clearly primitive recursive. Note that the Gödel numbering method encodes and decodes arbitrary finite sequences of numbers.

Uniqueness Property of Gödel Numbering

Theorem 8.2. If $[a_1, ..., a_n] = [b_1, ..., b_n]$, then

 $a_i = b_i$

for all $i = 1, \ldots, n$.

This result is an immediate consequence of the uniqueness of the factorization of integers into primes, sometimes referred to as the *unique factorization theorem*. Note that,

 $1 = 2^0 = 2^0 3^0 = 2^0 3^0 5^0 = \dots,$

hence it is natural to regard 1 as the Gödel number of the "empty" sequence (i.e., the sequence of length 0).

Preliminaries (1) Programs and Computable Functions (2) Primitive Recursive Functions (3) Primitive Recursive Function

Function $(x)_i$

We now define a primitive recursive function $(x)_i$ so that if

 $x = [a_1, \ldots, a_n]$

then $(x)_i = a_i$. We set

$$(x)_i = \min_{t \le x} (\sim p_i^{t+1} | x)$$

Note that $(x)_0 = 0$, and $(0)_i = 0$ for all *i*.

Preliminaries (1) Programs and Computable Functions (2) Primitive Recursive Functions (3) Minimalization (3.7) Pairing Functions and Gödel Numbers (3.9)

Function Lt(x)

We also define the "length" function Lt,

$$Lt(x) = \min_{i \le x} [(x)_i \neq 0 \& (\forall j)_{\le x} (j \le i \lor (x)_j = 0)]$$

For example, if $x = 20 = 2^2 \cdot 5^1 = [2, 0, 1]$ then $(x)_1 = 2, (x)_2 = 0, (x)_3 = 1$, but $(x)_4 = 0, (x)_5 = 0, \dots, (x)_i = 0$, for all $i \ge 4$. So Lt(20) = 3. Note that Lt(0) = Lt(1) = 0.

If x > 1, and Lt(x) = n, then p_n divides x but no prime greater than p_n divides x.

PRC Classes (3.3) Preliminaries (1) Programs and Computable Functions (2) Primitive Recursive Functions (3) Primitive Recursive Functions (3)

Sequence Number Theorem

Theorem 8.3.

$([a_1,\ldots,a_n])_i = \left\{egin{array}{cc} a_i & ext{if } 1 \leq i \leq n \\ 0 & ext{otherwise.} \end{array} ight.$

2.

1.

 $[(x)_1,...,(x)_n] = x \text{ if } n \ge Lt(x).$
