## Session: File System and Commands Topic: Numbering Systems

## Daniel Chang

Number vs. Numeral

- What is the difference between a number and a numeral?

- A "Numeral" is a written representation of the concept of a "Number" of some objects

## Analogy

- Coins can be thought of a symbolic representation of some "Number" of cash

- We make change for a given "Number" ("Quantity") using some combination of Coins with various values
- How do we use "Numerals"?

Decimal Numbering System (Base 10)

| Column <br> Values | 1000 | 100 | 10 | 1 |
| :--- | :---: | :---: | :---: | :---: |

- Each column has a value (ones, tens, hundreds)
- Actual column value is base to an exponent (hence base-10)

| Column <br> Values | 1000 | 100 | 10 | 1 |
| :--- | :---: | :---: | :---: | :---: |
|  | $=10^{3}$ | $=10^{2}$ | $=10^{1}$ | $=10^{0}$ |

General Numbering System (Base X)

| Actual <br> Values | $\mathrm{X}^{3}$ | $\mathrm{X}^{2}$ | $\mathrm{X}^{1}$ | $\mathrm{X}^{0}$ |
| :--- | :---: | :---: | :---: | :---: |
| Possible <br> Digits | 0 to (X-1) | 0 to $(\mathrm{X}-1)$ | 0 to $(\mathrm{X}-1)$ | 0 to $(\mathrm{X}-1)$ |

- Any column can only count up to ( $\mathrm{X}-1$ ), because one more would roll over to the value of the next column (to left)

Common Bases

| Base | Common Name | Representation | Digits |
| :--- | :--- | :--- | :--- |
| 10 | Decimal | $(N)_{10}$ | $0-9$ |
| 2 | Binary | $(N)_{2}$ | $0-1$ |
| 8 | Octal | $(N)_{8}$ | $0-7$ |
| 16 | Hexadecimal | $(N)_{16}, 0 \times N$ | $0-9$, A-F |

## Binary

- The numbering system using only zeroes and ones is called "Binary"
- A single binary digit ("0" or "1") is a "bit"
- Can use varying number of bits to create different patterns to represent larger numbers of different "things" (letters, etc.)

## Binary Numbering System

- Binary is the numbering system used in computers
- Here bits are used to represent actual numeric values
- For any pattern of bits, each position is given a value and a "1" means you include the value while a " 0 " means you do not

| Column <br> Values | 8 | 4 | 2 | 1 |
| :--- | :---: | :---: | :---: | :---: |
| Digits | 1 | 0 | 1 | 1 |
| Total | $1^{*} 8$ | $0 * 4$ | $1^{*} 2$ | $1^{*} 1$ |
| Quantity |  |  |  |  |
|  | 8 | +4 | +2 | +1 |

- The right-most digit in a binary number is always worth "1"
- Each other column has a value that is two (2) times the column to the left
- Actual column value is the base " 2 " to an exponent
- Hence "binary" is also called "base-2"

| Column <br> Values | 8 | 4 | 2 | 1 |
| :--- | :---: | :---: | :---: | :---: |
|  | $=2^{3}$ | $=4^{2}$ | $=2^{1}$ | $=1^{0}$ |

## What quantity of objects is represented by the binary numeral:

- $(1)_{2}$
- $(101)_{2}$
- (000000001001) ${ }_{2}$
- $(11001)_{2}$

## Hexadecimal

- Hexadecimal (base-16) is another numbering system used in computers
- Each single digit position can have up to 16 different values (compared to 10 or 2)
- Each single digit is represented by (0-9) and then (A-F)
- The right-most digit in a hexadecimal number is always worth "1"
- Each other column has a value that is sixteen (16) times the column to the left

| Column Values | 4096 | 256 | 16 | 1 | Quantity |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Digits | 0 | 0 | 2 | A |  |
| Total | 0 * 4096 | 0*256 | 2*16 | 10 * 1 |  |
|  | 0 | + 0 | + 32 | + 10 | $=(42) Q^{2}$ |

- Each Hexadecimal digit is equivalent to the value of four (4) binary digits, and you can easily convert between the two
- You must have exactly four (4) binary digits for one (1) hexadecimal digit

|  |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: |
| Hex | 0 | 0 | 2 | A |
| Quantity <br> $=(42)_{Q}$ |  |  |  |  |
| Binary | 0000 | 0000 | 0010 | 1010 |
| $=(42)_{Q}$ |  |  |  |  |

- Hexadecimal numerals are often indicated using "0x"
$0 x b 3 f d$
$0 \times F F$

What quantity of objects is represented by the hexadecimal numeral:

- $0 x 4$
- 0xB
- 0x001F

What is the binary equivalent to:

- 0x 0032 B9A5

## Conversion

- First convert numeral to quantity (number) by adding up amounts of column values

| Column <br> Values | 1000 | 100 | 10 | 1 |  |
| :--- | :---: | :---: | :---: | :---: | :--- |
| $(13)_{10}$ | 0 | 0 | 1 | 3 |  |
| Total | 0 | 0 | $1^{*} 10$ | $3 * 1$ | Quantity |
|  |  |  | 10 | +3 | $=(13)_{Q}$ |

- Then convert quantity to target base by selecting amounts from each column, starting with largest possible
- Similar to making change in a very unusual coin system

| Column <br> Values | 512 | 64 | 8 | 1 | Base-8 |
| :--- | :---: | :---: | :---: | :---: | :--- |
| $(13)_{\mathrm{Q}}$ | 0 | 0 | 1 | 5 |  |
| Total | 0 | 0 | $1 * 8$ | $5 * 1$ |  |
| Remain |  |  | $=5$ | $=0$ |  |

Tips

- Decimal numerals are essentially equivalent to the quantity (because we think in decimal)
- Bases that are multiples of each other have direct correspondence between digits, so can convert directly between bases

## Bases

| base $^{\text {base }}$ | base $^{6}$ | base $^{5}$ | base $^{4}$ | base $^{3}$ | base $^{2}$ | base $^{1}$ | base $^{0}$ | base $^{-1}$ | base $^{-2}$ | base $^{-3}$ |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 2 | 128 | 64 | 32 | 16 | 8 | 4 | 2 | 1 | 0.5 | 0.25 | 0.125 |
| 8 | - | - | 32768 | 4096 | 512 | 64 | 8 | 1 | 0.125 | 0.015625 | - |
| 16 |  |  |  | 65536 | 4096 | 256 | 16 | 1 | 0.0625 | - | - |

Conversions

| Quantity <br> (Value) | Numerals |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
|  | base-10 | base-2 | base-8 | base-2 | base-16 |
| 0 | 0 | 000 | 0 | 0000 | 0 |
| 1 | 1 | 001 | 1 | 0001 | 1 |
| 2 | 2 | 010 | 2 | 0010 | 2 |
| 3 | 3 | 011 | 3 | 0011 | 3 |
| 4 | 4 | 100 | 4 | 0100 | 4 |
| 5 | 5 | 101 | 5 | 0101 | 5 |
| 6 | 6 | 110 | 6 | 0110 | 6 |
| 7 | 7 | 111 | 7 | 0111 | 7 |
| 8 | 8 | 1000 | 10 | 1000 | 8 |
| 9 | 9 | 1001 | 11 | 1001 | 9 |
| 10 | 10 | 1010 | 12 | 1010 | A |
| 11 | 11 | 1011 | 13 | 1011 | B |
| 12 | 12 | 1100 | 14 | 1100 | C |
| 13 | 13 | 1101 | 15 | 1101 | D |
| 14 | 14 | 1110 | 16 | 1110 | E |
| 15 | 15 | 1111 | 17 | 1111 | F |

## Examples

Given the numeral $(27)_{10}$, what is the equivalent numeral in

- Binary
- Base-16

Given the numeral (34) ${ }_{8}$, what is the equivalent numeral in

- Base-10
- Base-2, which is then equivalent to what Decimal numeral?
- Base-2, calculated in less than 2 seconds

What is the binary equivalent to:

- $(\text { F9C5 })_{16}$

Mathematically
$(27)_{10}=(?)_{2}$
$=(?)_{16}$
$(34)_{8} \quad=(?)_{10}$
$=(?)_{2} \quad=(?)_{10}$
$=(? ?)_{2}$
$(\text { F9C5 })_{16}=(?)_{2}$
