

# Web services and email: web services

An important web service is simple delivery of html over http (hypertext transfer protocol).

The current version of http in use is 1.1, defined in RFC 2616. (There was an early stab at an http 1.2, but it didn't jell.)

## Netcraft survey

The most popular webserver is the Apache webserver, with an overall 46% market share according to Netcraft's current webserver survey, and powers 66% of the 1,000,000 most active sites.

[http://news.netcraft.com/archives/web\\_server\\_survey.html](http://news.netcraft.com/archives/web_server_survey.html)

Apache has two current versions, 1.3 and the 2.x versions, but 1.3 is now considered a “legacy” system and Apache now recommends:

“Apache 1.3.41 is the current stable release of the Apache 1.3 family. We strongly recommend that users of all earlier versions, including 1.3 family release, upgrade to to the current 2.2 version as soon as possible.”

(<http://www.apache.org/dist/httpd/Announcement1.3.html>)

Google and qq.com have become much more prominent in the last two years on the Netcraft survey, with lighthttpd dropping away this year.

# Security Space survey

There is another webserver survey that uses a somewhat different methodology than Netcraft at Security Space

[http://www.securityspace.com/s\\_survey/data/200902/index.html](http://www.securityspace.com/s_survey/data/200902/index.html)

which you can view many different server statistics.

# Conversations over http

What does a typical conversation look like? Here's one request and answer for a page:

Hypertext Transfer Protocol

```
GET /rfcs/rfc2612.html HTTP/1.1
```

```
Request Method: GET
```

```
Request URI: /rfcs/rfc2612.html
```

```
Request Version: HTTP/1.1

CNT 4603

Spring 2009

CNT 4603

# Encoding and chunking

While in theory encoding allows for any type of arbitrary encoding of the body, http level encoding in practice is used to allow a server to optimize its use of bandwidth by optionally choosing when it would like to compress or gzip a body.

Chunking is almost the reverse: it instead embeds redundant information into the message body to let the client make decisions about buffering and early rendering

of data. If chunking occurs, it is usually for dynamically generated data.

# Configuring Apache

Where you put your configuration data varies widely; while `/etc/httpd` is certainly common, you also might see `/etc/apache2` and other places. Also widely varying is where you might find your actual html files, the “documentroot”. On Redhat machines, `/var/www/html` has been the default directory. On OpenSuse, you would see `/srv/www/htdocs`.

The most important configuration file is `httpd.conf`

```
#
# This is the main Apache server configuration file. It contains the
# configuration directives that give the server its instructions.
# See <URL:http://httpd.apache.org/docs/2.2/> for detailed information.
# In particular, see
# <URL:http://httpd.apache.org/docs/2.2/mod/directives.html>
# for a discussion of each configuration directive.
#
#
# Do NOT simply read the instructions in here without understanding
# what they do. They're here only as hints or reminders. If you are unsure
# consult the online docs. You have been warned.
#
# The configuration directives are grouped into three basic sections:
# 1. Directives that control the operation of the Apache server process as a
#    whole (the 'global environment').
# 2. Directives that define the parameters of the 'main' or 'default' server,
#    which responds to requests that aren't handled by a virtual host.
#    These directives also provide default values for the settings
```

```
# of all virtual hosts.
# 3. Settings for virtual hosts, which allow Web requests to be sent to
# different IP addresses or hostnames and have them handled by the
# same Apache server process.
#
# Configuration and logfile names: If the filenames you specify for many
# of the server's control files begin with "/" (or "drive:/" for Win32), the
# server will use that explicit path.  If the filenames do *not* begin
# with "/", the value of ServerRoot is prepended -- so "logs/foo.log"
# with ServerRoot set to "/etc/httpd" will be interpreted by the
# server as "/etc/httpd/logs/foo.log".
#
```

### ### Section 1: Global Environment

```
#
# The directives in this section affect the overall operation of Apache,
# such as the number of concurrent requests it can handle or where it
# can find its configuration files.
#
```

Spring 2009

#

# Don't give away too much information about all the subcomponents  
# we are running. Comment out this line if you don't mind remote sites  
# finding out what major optional modules you are running

ServerTokens OS

#

# ServerRoot: The top of the directory tree under which the server's  
# configuration, error, and log files are kept.

#

# NOTE! If you intend to place this on an NFS (or otherwise network)

# mounted filesystem then please read the LockFile documentation

# (available at <URL:[http://httpd.apache.org/docs/2.2/mod/mpm\\_common.html#lockfile](http://httpd.apache.org/docs/2.2/mod/mpm_common.html#lockfile)>

# you will save yourself a lot of trouble.

#

# Do NOT add a slash at the end of the directory path.

#

ServerRoot "/etc/httpd"

#

CNT 4603

Spring 2009

```
# PidFile: The file in which the server should record its process
# identification number when it starts.
#
PidFile run/httpd.pid

#
# Timeout: The number of seconds before receives and sends time out.
#
Timeout 120

#
# KeepAlive: Whether or not to allow persistent connections (more than
# one request per connection). Set to "Off" to deactivate.
#
KeepAlive Off

#
# MaxKeepAliveRequests: The maximum number of requests to allow
# during a persistent connection. Set to 0 to allow an unlimited amount.
# We recommend you leave this number high, for maximum performance.
```

CNT 4603

Spring 2009

#

MaxKeepAliveRequests 100

#

# KeepAliveTimeout: Number of seconds to wait for the next request from the  
# same client on the same connection.

#

KeepAliveTimeout 15

##

## Server-Pool Size Regulation (MPM specific)

##

# prefork MPM

# StartServers: number of server processes to start

# MinSpareServers: minimum number of server processes which are kept spare

# MaxSpareServers: maximum number of server processes which are kept spare

# ServerLimit: maximum value for MaxClients for the lifetime of the server

# MaxClients: maximum number of server processes allowed to start

# MaxRequestsPerChild: maximum number of requests a server process serves

CNT 4603

```
<IfModule prefork.c>
StartServers      8
MinSpareServers   5
MaxSpareServers   20
ServerLimit       256
MaxClients        256
MaxRequestsPerChild 4000
</IfModule>
```

```
# worker MPM
# StartServers: initial number of server processes to start
# MaxClients: maximum number of simultaneous client connections
# MinSpareThreads: minimum number of worker threads which are kept spare
# MaxSpareThreads: maximum number of worker threads which are kept spare
# ThreadsPerChild: constant number of worker threads in each server process
# MaxRequestsPerChild: maximum number of requests a server process serves
```

```
<IfModule worker.c>
StartServers      2
MaxClients        150
MinSpareThreads   25
```

Spring 2009

```
MaxSpareThreads      75
ThreadsPerChild      25
MaxRequestsPerChild  0
</IfModule>
```

#

# Listen: Allows you to bind Apache to specific IP addresses and/or  
# ports, in addition to the default. See also the <VirtualHost>  
# directive.

#

# Change this to Listen on specific IP addresses as shown below to  
# prevent Apache from glomming onto all bound IP addresses (0.0.0.0)

#

```
#Listen 12.34.56.78:80
```

```
Listen 80
```

#

# Dynamic Shared Object (DSO) Support

#

# To be able to use the functionality of a module which was built as a DSO you

```
# have to place corresponding 'LoadModule' lines at this location so the
# directives contained in it are actually available before they are used.
# Statically compiled modules (those listed by 'httpd -l') do not need
# to be loaded here.
#
# Example:
# LoadModule foo_module modules/mod_foo.so
#
LoadModule auth_basic_module modules/mod_auth_basic.so
LoadModule auth_digest_module modules/mod_auth_digest.so
LoadModule authn_file_module modules/mod_authn_file.so
LoadModule authn_alias_module modules/mod_authn_alias.so
LoadModule authn_anon_module modules/mod_authn_anon.so
LoadModule authn_dbm_module modules/mod_authn_dbm.so
LoadModule authn_default_module modules/mod_authn_default.so
LoadModule authz_host_module modules/mod_authz_host.so
LoadModule authz_user_module modules/mod_authz_user.so
LoadModule authz_owner_module modules/mod_authz_owner.so
LoadModule authz_groupfile_module modules/mod_authz_groupfile.so
LoadModule authz_dbm_module modules/mod_authz_dbm.so
```

```
LoadModule authz_default_module modules/mod_authz_default.so
LoadModule ldap_module modules/mod_ldap.so
LoadModule authnz_ldap_module modules/mod_authnz_ldap.so
LoadModule include_module modules/mod_include.so
LoadModule log_config_module modules/mod_log_config.so
LoadModule logio_module modules/mod_logio.so
LoadModule env_module modules/mod_env.so
LoadModule ext_filter_module modules/mod_ext_filter.so
LoadModule mime_magic_module modules/mod_mime_magic.so
LoadModule expires_module modules/mod_expires.so
LoadModule deflate_module modules/mod_deflate.so
LoadModule headers_module modules/mod_headers.so
LoadModule usertrack_module modules/mod_usertrack.so
LoadModule setenvif_module modules/mod_setenvif.so
LoadModule mime_module modules/mod_mime.so
LoadModule dav_module modules/mod_dav.so
LoadModule status_module modules/mod_status.so
LoadModule autoindex_module modules/mod_autoindex.so
LoadModule info_module modules/mod_info.so
LoadModule dav_fs_module modules/mod_dav_fs.so
```

```
LoadModule vhost_alias_module modules/mod_vhost_alias.so
LoadModule negotiation_module modules/mod_negotiation.so
LoadModule dir_module modules/mod_dir.so
LoadModule actions_module modules/mod_actions.so
LoadModule speling_module modules/mod_speling.so
LoadModule userdir_module modules/mod_userdir.so
LoadModule alias_module modules/mod_alias.so
LoadModule rewrite_module modules/mod_rewrite.so
LoadModule proxy_module modules/mod_proxy.so
LoadModule proxy_balancer_module modules/mod_proxy_balancer.so
LoadModule proxy_ftp_module modules/mod_proxy_ftp.so
LoadModule proxy_http_module modules/mod_proxy_http.so
LoadModule proxy_connect_module modules/mod_proxy_connect.so
LoadModule cache_module modules/mod_cache.so
LoadModule suexec_module modules/mod_suexec.so
LoadModule disk_cache_module modules/mod_disk_cache.so
LoadModule file_cache_module modules/mod_file_cache.so
LoadModule mem_cache_module modules/mod_mem_cache.so
LoadModule cgi_module modules/mod_cgi.so
```

Spring 2009

```
#  
# The following modules are not loaded by default:  
#  
#LoadModule cern_meta_module modules/mod_cern_meta.so  
#LoadModule asis_module modules/mod_asis.so  
  
#  
# Load config files from the config directory "/etc/httpd/conf.d".  
#  
Include conf.d/*.conf  
  
#  
# ExtendedStatus controls whether Apache will generate "full" status  
# information (ExtendedStatus On) or just basic information (ExtendedStatus  
# Off) when the "server-status" handler is called. The default is Off.  
#  
#ExtendedStatus On  
  
#  
# If you wish httpd to run as a different user or group, you must run
```

CNT 4603

```
# httpd as root initially and it will switch.
#
# User/Group: The name (or #number) of the user/group to run httpd as.
# . On SCO (ODT 3) use "User nouser" and "Group nogroup".
# . On HPUX you may not be able to use shared memory as nobody, and the
#   suggested workaround is to create a user www and use that user.
# NOTE that some kernels refuse to setgid(Group) or semctl(IPC_SET)
# when the value of (unsigned)Group is above 60000;
# don't use Group #-1 on these systems!
#
User apache
Group apache
```

```
### Section 2: 'Main' server configuration
#
# The directives in this section set up the values used by the 'main'
# server, which responds to any requests that aren't handled by a
# <VirtualHost> definition. These values also provide defaults for
# any <VirtualHost> containers you may define later in the file.
#
```

```
# All of these directives may appear inside <VirtualHost> containers,  
# in which case these default settings will be overridden for the  
# virtual host being defined.  
#
```

```
#  
# ServerAdmin: Your address, where problems with the server should be  
# e-mailed. This address appears on some server-generated pages, such  
# as error documents. e.g. admin@your-domain.com  
#
```

```
ServerAdmin root@localhost
```

```
#  
# ServerName gives the name and port that the server uses to identify itself.  
# This can often be determined automatically, but we recommend you specify  
# it explicitly to prevent problems during startup.  
#
```

```
# If this is not set to valid DNS name for your host, server-generated  
# redirections will not work. See also the UseCanonicalName directive.  
#
```

Spring 2009

```
# If your host doesn't have a registered DNS name, enter its IP address here.  
# You will have to access it by its address anyway, and this will make  
# redirections work in a sensible way.
```

```
#
```

```
#ServerName www.example.com:80
```

```
#
```

```
# UseCanonicalName: Determines how Apache constructs self-referencing  
# URLs and the SERVER_NAME and SERVER_PORT variables.
```

```
# When set "Off", Apache will use the Hostname and Port supplied  
# by the client. When set "On", Apache will use the value of the  
# ServerName directive.
```

```
#
```

```
UseCanonicalName Off
```

```
#
```

```
# DocumentRoot: The directory out of which you will serve your  
# documents. By default, all requests are taken from this directory, but  
# symbolic links and aliases may be used to point to other locations.
```

```
#
```

```
DocumentRoot "/var/www/html"
```

```
#
```

```
# Each directory to which Apache has access can be configured with respect  
# to which services and features are allowed and/or disabled in that  
# directory (and its subdirectories).
```

```
#
```

```
# First, we configure the "default" to be a very restrictive set of  
# features.
```

```
#
```

```
<Directory />
```

```
    Options FollowSymLinks
```

```
    AllowOverride None
```

```
</Directory>
```

```
#
```

```
# Note that from this point forward you must specifically allow  
# particular features to be enabled - so if something's not working as  
# you might expect, make sure that you have specifically enabled it  
# below.
```

#

#

# This should be changed to whatever you set DocumentRoot to.

#

<Directory "/var/www/html">

#

# Possible values for the Options directive are "None", "All",

# or any combination of:

# Indexes Includes FollowSymLinks SymLinksifOwnerMatch ExecCGI MultiViews

#

# Note that "MultiViews" must be named *explicitly* --- "Options All"

# doesn't give it to you.

#

# The Options directive is both complicated and important. Please see

# <http://httpd.apache.org/docs/2.2/mod/core.html#options>

# for more information.

#

Options Indexes FollowSymLinks

```
#
# AllowOverride controls what directives may be placed in .htaccess files.
# It can be "All", "None", or any combination of the keywords:
#   Options FileInfo AuthConfig Limit
#
#   AllowOverride None

#
# Controls who can get stuff from this server.
#
#   Order allow,deny
#   Allow from all

</Directory>

#
# UserDir: The name of the directory that is appended onto a user's home
# directory if a ~user request is received.
#
```

```
# The path to the end user account 'public_html' directory must be
# accessible to the webserver userid. This usually means that ~userid
# must have permissions of 711, ~userid/public_html must have permissions
# of 755, and documents contained therein must be world-readable.
# Otherwise, the client will only receive a "403 Forbidden" message.
#
# See also: http://httpd.apache.org/docs/misc/FAQ.html#forbidden
#
<IfModule mod_userdir.c>
    #
    # UserDir is disabled by default since it can confirm the presence
    # of a username on the system (depending on home directory
    # permissions).
    #
    UserDir disable

    #
    # To enable requests to /~user/ to serve the user's public_html
    # directory, remove the "UserDir disable" line above, and uncomment
    # the following line instead:
```

```
#  
#UserDir public_html
```

```
</IfModule>
```

```
#  
# Control access to UserDir directories. The following is an example  
# for a site where these directories are restricted to read-only.  
#  
#<Directory /home/*/public_html>  
#   AllowOverride FileInfo AuthConfig Limit  
#   Options MultiViews Indexes SymLinksIfOwnerMatch IncludesNoExec  
#   <Limit GET POST OPTIONS>  
#       Order allow,deny  
#       Allow from all  
#   </Limit>  
#   <LimitExcept GET POST OPTIONS>  
#       Order deny,allow  
#       Deny from all  
#   </LimitExcept>
```

```
#</Directory>
```

```
#
```

```
# DirectoryIndex: sets the file that Apache will serve if a directory  
# is requested.
```

```
#
```

```
# The index.html.var file (a type-map) is used to deliver content-  
# negotiated documents. The MultiViews Option can be used for the  
# same purpose, but it is much slower.
```

```
#
```

```
DirectoryIndex index.html index.html.var
```

```
#
```

```
# AccessFileName: The name of the file to look for in each directory  
# for additional configuration directives. See also the AllowOverride  
# directive.
```

```
#
```

```
AccessFileName .htaccess
```

```
#
```

Spring 2009

```
# The following lines prevent .htaccess and .htpasswd files from being  
# viewed by Web clients.
```

```
#
```

```

# http://httpd.apache.org/docs/2.2/mod/core.html#enablesendfile
#
#EnableSendfile off

#
# ErrorLog: The location of the error log file.
# If you do not specify an ErrorLog directive within a <VirtualHost>
# container, error messages relating to that virtual host will be
# logged here.  If you *do* define an error logfile for a <VirtualHost>
# container, that host's errors will be logged there and not here.
#
ErrorLog logs/error_log

#
# LogLevel: Control the number of messages logged to the error_log.
# Possible values include: debug, info, notice, warn, error, crit,
# alert, emerg.
#
LogLevel warn
```

CNT 4603

```
#
# The following directives define some format nicknames for use with
# a CustomLog directive (see below).
#
LogFormat "%h %l %u %t \"%r\" %>s %b \"%{Referer}i\" \"%{User-Agent}i\"" combined
LogFormat "%h %l %u %t \"%r\" %>s %b" common
LogFormat "%{Referer}i -> %U" referer
LogFormat "%{User-agent}i" agent

# "combinedio" includes actual counts of actual bytes received (%I) and sent (%O);
# requires the mod_logio module to be loaded.
#LogFormat "%h %l %u %t \"%r\" %>s %b \"%{Referer}i\" \"%{User-Agent}i\" %I %O" combinedio

#
# The location and format of the access logfile (Common Logfile Format).
# If you do not define any access logfiles within a <VirtualHost>
# container, they will be logged here. Contrariwise, if you *do*
# define per-<VirtualHost> access logfiles, transactions will be
# logged therein and *not* in this file.
#
```

```
#CustomLog logs/access_log common
```

```
#
```

```
# If you would like to have separate agent and referer logfiles, uncomment  
# the following directives.
```

```
#
```

```
#CustomLog logs/referer_log referer
```

```
#CustomLog logs/agent_log agent
```

```
#
```

```
# For a single logfile with access, agent, and referer information  
# (Combined Logfile Format), use the following directive:
```

```
#
```

```
CustomLog logs/access_log combined
```

```
#
```

```
# Optionally add a line containing the server version and virtual host  
# name to server-generated pages (internal error documents, FTP directory  
# listings, mod_status and mod_info output etc., but not CGI generated  
# documents or custom error documents).
```

Spring 2009

```
# Set to "EMail" to also include a mailto: link to the ServerAdmin.
# Set to one of:  On | Off | EMail
#
ServerSignature On

#
# Aliases: Add here as many aliases as you need (with no limit). The format is
# Alias fakename realname
#
# Note that if you include a trailing / on fakename then the server will
# require it to be present in the URL.  So "/icons" isn't aliased in this
# example, only "/icons/".  If the fakename is slash-terminated, then the
# realname must also be slash terminated, and if the fakename omits the
# trailing slash, the realname must also omit it.
#
# We include the /icons/ alias for FancyIndexed directory listings.  If you
# do not use FancyIndexing, you may comment this out.
#
Alias /icons/ "/var/www/icons/"

# DefaultLanguage and AddLanguage allows you to specify the language of
```

CNT 4603

```
# a document. You can then use content negotiation to give a browser a
# file in a language the user can understand.
#
# Specify a default language. This means that all data
# going out without a specific language tag (see below) will
# be marked with this one. You probably do NOT want to set
# this unless you are sure it is correct for all cases.
#
# * It is generally better to not mark a page as
# * being a certain language than marking it with the wrong
# * language!
#
# DefaultLanguage nl
#
# Note 1: The suffix does not have to be the same as the language
# keyword --- those with documents in Polish (whose net-standard
# language code is pl) may wish to use "AddLanguage pl .po" to
# avoid the ambiguity with the common suffix for perl scripts.
#
# Note 2: The example entries below illustrate that in some cases
```

```
# the two character 'Language' abbreviation is not identical to
# the two character 'Country' code for its country,
# E.g. 'Danmark/dk' versus 'Danish/da'.
#
# Note 3: In the case of 'ltz' we violate the RFC by using a three char
# specifier. There is 'work in progress' to fix this and get
# the reference data for rfc1766 cleaned up.
#
# Catalan (ca) - Croatian (hr) - Czech (cs) - Danish (da) - Dutch (nl)
# English (en) - Esperanto (eo) - Estonian (et) - French (fr) - German (de)

# MULTIPLE CHOICES (Prefer) [in case of a tie] or NOT ACCEPTABLE (Fallback)  
# [in case no accepted languages matched the available variants]
```

```
#
```

```
ForceLanguagePriority Prefer Fallback
```

```
#
```

```
# Specify a default charset for all content served; this enables
# interpretation of all content as UTF-8 by default. To use the
# default browser choice (ISO-8859-1), or to allow the META tags
# in HTML content to override this choice, comment out this
# directive:
#
AddDefaultCharset UTF-8

#
# AddType allows you to add to or override the MIME configuration
# file mime.types for specific file types.
#
#AddType application/x-tar .tgz

#
# AddEncoding allows you to have certain browsers uncompress
# information on the fly. Note: Not all browsers support this.
# Despite the name similarity, the following Add* directives have nothing
# to do with the FancyIndexing customization directives above.
#
```

Spring 2009

```
#AddEncoding x-compress .Z
#AddEncoding x-gzip .gz .tgz
```

```
# If the AddEncoding directives above are commented-out, then you
# probably should define those extensions to indicate media types:
#
```

```
AddType application/x-compress .Z
AddType application/x-gzip .gz .tgz
```

```
#
# AddHandler allows you to map certain file extensions to "handlers":
# actions unrelated to filetype. These can be either built into the server
# or added with the Action directive (see below)
```

```
#
# To use CGI scripts outside of ScriptAliased directories:
# (You will also need to add "ExecCGI" to the "Options" directive.)
```

```
#
#AddHandler cgi-script .cgi
```

```
#
```

CNT 4603

Spring 2009

```
# For files that include their own HTTP headers:
#
#AddHandler send-as-is asis

#
# For type maps (negotiated resources):
# (This is enabled by default to allow the Apache "It Worked" page
# to be distributed in multiple languages.)
#
AddHandler type-map var

#
# Filters allow you to process content before it is sent to the client.
#
# To parse .shtml files for server-side includes (SSI):
# (You will also need to add "Includes" to the "Options" directive.)
#
AddType text/html .shtml
AddOutputFilter INCLUDES .shtml
```

CNT 4603

```
#  
# Action lets you define media types that will execute a script whenever  
# a matching file is called. This eliminates the need for repeated URL  
# pathnames for oft-used CGI file processors.  
# Format: Action media/type /cgi-script/location  
# Format: Action handler-name /cgi-script/location  
#  
  
#  
# Customizable error responses come in three flavors:  
# 1) plain text 2) local redirects 3) external redirects  
#  
# Some examples:  
#ErrorDocument 500 "The server made a boo boo."  
#ErrorDocument 404 /missing.html  
#ErrorDocument 404 "/cgi-bin/missing_handler.pl"  
#ErrorDocument 402 http://www.example.com/subscription_info.html  
#  
  
#
```

```
# Putting this all together, we can internationalize error responses.
#
# We use Alias to redirect any /error/HTTP_<error>.html.var response to
# our collection of by-error message multi-language collections. We use
# includes to substitute the appropriate text.
#
# You can modify the messages' appearance without changing any of the
# default HTTP_<error>.html.var files by adding the line:
#
#   Alias /error/include/ "/your/include/path/"
#
# which allows you to create your own set of files by starting with the
# /var/www/error/include/ files and
# copying them to /your/include/path/, even on a per-VirtualHost basis.
#

Alias /error/ "/var/www/error/"

# End of proxy directives.  
  
### Section 3: Virtual Hosts  
#  
# VirtualHost: If you want to maintain multiple domains/hostnames on your  
# machine you can setup VirtualHost containers for them. Most configurations  
# use only name-based virtual hosts so the server doesn't need to worry about  
# IP addresses. This is indicated by the asterisks in the directives below.
```

Spring 2009

```
#  
# Please see the documentation at  
# <URL:http://httpd.apache.org/docs/2.2/vhosts/>  
# for further details before you try to setup virtual hosts.  
#  
# You may use the command line option '-S' to verify your virtual host  
# configuration.  
  
#  
# Use name-based virtual hosting.  
#  
#NameVirtualHost *:80  
#  
# NOTE: NameVirtualHost cannot be used without a port specifier  
# (e.g. :80) if mod_ssl is being used, due to the nature of the  
# SSL protocol.  
#  
  
#  
# VirtualHost example:
```

CNT 4603

```
# Almost any Apache directive may go into a VirtualHost container.
# The first VirtualHost section is used for requests without a known
# server name.
#
#<VirtualHost *:80>
#     ServerAdmin webmaster@dummy-host.example.com
#     DocumentRoot /www/docs/dummy-host.example.com
#     ServerName dummy-host.example.com
#     ErrorLog logs/dummy-host.example.com-error_log
#     CustomLog logs/dummy-host.example.com-access_log common
#</VirtualHost>
```
