Worst-Case Loop Analysis Algorithm

iterations_handled = 0.

while (iterations_handled < N) **do**

do

 Find longest path available for execution.

 Use this longest path for 1 iteration.

 iterations_handled += 1.

while (longest path's caching behavior changes).

 iters_to_do =

 longest path's required iterations +

 min (longest path's nonrequired iterations,

 loop's nonrequired iterations).

 Use this longest path for iters_to_do iterations.

 iterations_handled += iters_to_do.
