A D N A B N A B N A B N

• A cryptographic hash (a.k.a. message digest) is a one-way function

▲ 同 ▶ → 三 ▶

- A cryptographic hash (a.k.a. message digest) is a one-way function
   One-way: no reverse function for a hash (unlike encryption)
  - It takes arbitrary-length input and generate fixed-length output
  - It requires at least 128-bit output

- A cryptographic hash (a.k.a. message digest) is a one-way function
   One-way: no reverse function for a hash (unlike encryption)
   It takes arbitrary-length input and generate fixed-length output
  - It requires at least 128-bit output (birthday problem)

- A cryptographic hash (a.k.a. message digest) is a one-way function
   One-way: no reverse function for a hash (unlike encryption)
   It takes arbitrary-length input and generate fixed-length output
   It requires at least 128-bit output (birthday problem)
- It should be fast to compute and have strong cryptographic strengths

# Hash Function Properties

#### One-way property (pre-image resistance):

Given h, it's computationally infeasible to find m with h = H(m)

< □ > < 同 > < 回 > < 回 > < 回 >

## Hash Function Properties

#### One-way property (pre-image resistance):

Given h, it's computationally infeasible to find m with h = H(m)

Weak collision resistance (second-preimage resistance):

Given  $m_1$ , it's computationally infeasible to find  $m_2$  with  $H(m_1) = H(m_2)$ 

イロト イヨト イヨト イヨト

# Hash Function Properties

#### One-way property (pre-image resistance):

Given h, it's computationally infeasible to find m with h = H(m)

Weak collision resistance (second-preimage resistance):

Given  $m_1$ , it's computationally infeasible to find  $m_2$  with  $H(m_1) = H(m_2)$ 

#### Strong collision resistance:

It's computationally infeasible to find  $m_1$  and  $m_2$  with  $H(m_1) = H(m_2)$ 

イロト 不得 トイヨト イヨト 二日

# Length of Hash Output

- What is the "right" size?
  - unnecessary overhead if too long
  - loss of strong collision resistance if too short (birthday problem)

・ 何 ト ・ ヨ ト ・ ヨ ト

# Length of Hash Output

- What is the "right" size?
  - unnecessary overhead if too long
  - loss of strong collision resistance if too short (birthday problem)
- A hash normally has 128 or 160 bits of output

#### Birthday Problem:

what's the smallest number of people (n) in a room such that the probability of at least two of them having the same birthday is greater than 50%?

assuming 365 days/year (k), and equal distribution of birthdays

(4) (日本)

#### Birthday Problem:

what's the smallest number of people (n) in a room such that the probability of at least two of them having the same birthday is greater than 50%?

 $\blacksquare$  assuming 365 days/year (k), and equal distribution of birthdays

• The answer is 23, or, more generally, about  $k^{\frac{1}{2}}$ 

#### Birthday Problem:

what's the smallest number of people (n) in a room such that the probability of at least two of them having the same birthday is greater than 50%?

 $\blacksquare$  assuming 365 days/year (k), and equal distribution of birthdays

- The answer is 23, or, more generally, about  $k^{\frac{1}{2}}$
- A brute-force attack needs to try  $2^{\frac{len(h)}{2}}$  messages before finding two messages with the same hash at 50% chance  $(k = 2^{len(h)})$

・ 何 ト ・ ヨ ト ・ ヨ ト

#### Birthday Problem:

what's the smallest number of people (n) in a room such that the probability of at least two of them having the same birthday is greater than 50%?

 $\blacksquare$  assuming 365 days/year (k), and equal distribution of birthdays

- The answer is 23, or, more generally, about  $k^{\frac{1}{2}}$
- A brute-force attack needs to try 2<sup>len(h)</sup>/<sub>2</sub> messages before finding two messages with the same hash at 50% chance (k = 2<sup>len(h)</sup>)
   64-bit hash only has 32 bits of strong collision resistance

# Birthday Problem (by Wrong Math)

- Birthday problem
  - **••** *n* people can form  $\frac{n(n-1)}{2}$  different groups
  - $\blacksquare$  each group has a chance of  $\frac{1}{k}$  to have the same birthday
  - **•••** adding them together:  $\frac{n(n-1)}{2k}$

# Birthday Problem (by Wrong Math)

- Birthday problem
  - **m** people can form  $\frac{n(n-1)}{2}$  different groups
  - each group has a chance of  $\frac{1}{k}$  to have the same birthday

 $\blacksquare$  adding them together:  $\frac{n(n-1)}{2k}$ 

- But, groups are not independent of each other.
  - cannot simply add them!
  - $\blacksquare$  e.g., if 30 people  $\rightarrow$  435 groups  $\rightarrow$  a probability of 119

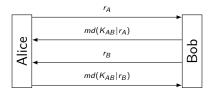

#### • Probability of n people have different birthdays is: $P = \frac{(365)_n}{365^n} = \frac{365 \times 364 \times \ldots \times (365 - n + 1)}{365^n}$

(日) (四) (日) (日) (日)

- Probability of n people have different birthdays is:  $P = \frac{(365)_n}{365^n} = \frac{365 \times 364 \times \ldots \times (365 - n + 1)}{365^n}$
- Probability of at least two people have the same birthday is: 1 P $1 - P \ge 0.5 \rightarrow P < 0.5 \rightarrow \frac{(365)n}{365^n} < 0.5 \rightarrow n = 23$

#### Authentication

- Alice and Bob shares a secret key K<sub>AB</sub> in advance
- Alice challenges Bob by sending a random number  $r_A$
- Bob returns the hash of K<sub>AB</sub>|r<sub>A</sub>
   in authentication with SKC, Bob returns K<sub>AB</sub>{r<sub>A</sub>}
- Alice also computes its hash, and compares it to Bob's
   in authentication with SKC, Alice decrypts Bob's message

→ Ξ →

#### • Sending hash with plaintext does not work

- hash can detect benign errors (e.g., storage or network failure)
- attackers can modify the message and regenerate the hash

- Sending hash with plaintext does not work
  - hash can detect benign errors (e.g., storage or network failure)
     attackers can modify the message and regenerate the hash
- MAC requires keyed hash: Alice and Bob shares a secret  $K_{AB}$

▲ □ ▶ ▲ 三 ▶ ▲ 三

- Sending hash with plaintext does not work
   mathematic hash can detect benign errors (e.g., storage or network failure)
  - attackers can modify the message and regenerate the hash
- MAC requires keyed hash: Alice and Bob shares a secret K<sub>AB</sub>

   *■* extension attack: given m<sub>1</sub> and md(K<sub>AB</sub>|m<sub>1</sub>), we can compute md(K<sub>AB</sub>|m<sub>1</sub>|m<sub>2</sub>) by using md(K<sub>AB</sub>|m<sub>1</sub>) as the IV, how?

- Sending hash with plaintext does not work

# HMAC (Hash-based MAC)

• 
$$HMAC(K, m) = MD((K \oplus c_2)|MD((K \oplus c_1)|m))$$

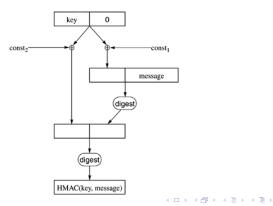

Zhi Wang (FSU)

CNT4406/5412 Network Security

# HMAC (Hash-based MAC)

- $HMAC(K, m) = MD((K \oplus c_2)|MD((K \oplus c_1)|m))$
- Nested digest with secrets prevents the extension attack
   the inner digest is not revealed to the attacker

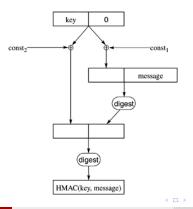

CNT4406/5412 Network Security

Fall 2014 10 / 30

# HMAC (Hash-based MAC)

- $HMAC(K, m) = MD((K \oplus c_2)|MD((K \oplus c_1)|m))$
- Nested digest with secrets prevents the extension attack
   the inner digest is not revealed to the attacker
- HMAC is proved to be secure if underlying message digest is secure

Zhi Wang (FSU)

CNT4406/5412 Network Security

Fall 2014 10 / 30

### Encryption with Message Digest

Generate a one-time pad to be ⊕'ed to the plaintext
 im from *IV* and a key (like OFB):
 b<sub>1</sub> = MD(K<sub>AB</sub>|IV), b<sub>2</sub> = MD(K<sub>AB</sub>|b<sub>1</sub>),...

イロト イポト イヨト イヨト

## Encryption with Message Digest

Generate a one-time pad to be ⊕'ed to the plaintext
 im from *IV* and a key (like OFB):
 b<sub>1</sub> = MD(K<sub>AB</sub>|IV), b<sub>2</sub> = MD(K<sub>AB</sub>|b<sub>1</sub>),...

#### or

mixing in the ciphertext (like CFB):  

$$b_1 = MD(K_{AB}|IV)$$
  $c_1 = p_1 \oplus b_1$   
 $b_2 = MD(K_{AB}|c_1)$   $c_2 = p_2 \oplus b_2$   
...

イロト イポト イヨト イヨト

# **Digital Signature**

- Public key cryptography is too slow to sign large messages
   message generate and sign the cryptographic hash of the message
  - rely on the security of the hash function

< ∃ ►

- Commitment protocol: making a verifiable commitment without revealing it
  - Alice and Bob play the game of "odd or even" online:

(4) (日本)

- Commitment protocol: making a verifiable commitment without revealing it
  - Alice and Bob play the game of "odd or even" online:
  - Alice and Bob both pick a number

- Commitment protocol: making a verifiable commitment without revealing it
  - Alice and Bob play the game of "odd or even" online:
  - Alice and Bob both pick a number
  - they exchange the number at the "exactly" same time

A B A A B A

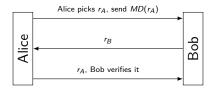

- Commitment protocol: making a verifiable commitment without revealing it
  - Alice and Bob play the game of "odd or even" online:
  - Alice and Bob both pick a number
  - they exchange the number at the "exactly" same time
  - Alice wins if the sum of the numbers are odd, otherwise Bob wins

- E > - E >

- Commitment protocol: making a verifiable commitment without revealing it
  - Alice and Bob play the game of "odd or even" online:
  - Alice and Bob both pick a number
  - they exchange the number at the "exactly" same time
  - Alice wins if the sum of the numbers are odd, otherwise Bob wins
  - but, it is difficult to get the "exactly" same time, one who delays until having received the other's number can easily cheat!

< 同 > < 三 > < 三 >

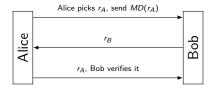

• **Solution:** Alice makes a verifiable commitment before Bob sends his number, explain in details?

★ ∃ →

# **Commitment Protocol**

- **Solution:** Alice makes a verifiable commitment before Bob sends his number, explain in details?
- Will this protocol work for the paper-scissors-rock game? why?

# Common Structure

- Initialize message digest to a fixed constant
- Update the current digest with the next block of message
  - $\blacksquare$  also called the compression function (512 bits  $\rightarrow$  digest length)
  - block by block (extension attack)
- Output the final result as the digest for the entire message

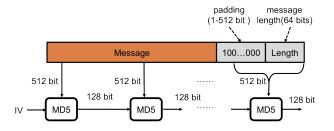

Zhi Wang (FSU)

Fall 2014 17 / 30

< ∃ > < ∃

#### MD5: Overview

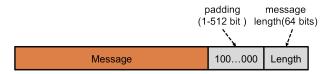

- Pad message to a multiple of 512 bits
- Digest message block by block (also called stages)

▲ □ ▶ ▲ □ ▶ ▲ □ ▶

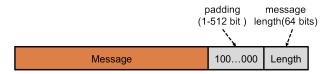

Zhi Wang (FSU)

• Start padding with a 1, followed by just enough 0 bits to make the message of  $512 \times n - 64$  bits

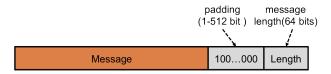

A D N A B N A B N A B N

Start padding with a 1, followed by just enough 0 bits to make the message of 512 × n − 64 bits
 what if the original message has 512 × n bits?

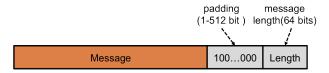

・ 何 ト ・ ヨ ト ・ ヨ ト

#### SHA-1

# Structurally similar to MD4 and MD5 work in stages and use the same message padding

A D N A B N A B N A B N

# SHA-1

- Structurally similar to MD4 and MD5
   work in stages and use the same message padding
- Process messages in 512-bit blocks, produce 160-bit digest
   message block: 16 32-bit words named as w<sub>0</sub>, w<sub>1</sub>, ..., w<sub>15</sub>
   digest: 5 words named as A, B, C, D, E

▲ □ ▶ ▲ □ ▶ ▲ □ ▶

# SHA-1

- Structurally similar to MD4 and MD5
   work in stages and use the same message padding
- Process messages in 512-bit blocks, produce 160-bit digest
   message block: 16 32-bit words named as w<sub>0</sub>, w<sub>1</sub>, ..., w<sub>15</sub>
   digest: 5 words named as A, B, C, D, E
- Each SHA-1 stage has 5 passes
   a pre-process pass to extend the block to 80 words (32 bits), grouped into 4 sets of 20 words
  - four digest passes each updates the digest with its set of words

・ 同 ト ・ ヨ ト ・ ヨ ト

#### SHA1: Preprocess Pass

- Extend the message block into 80 words
  - words 0 to 15 are just copied over

$$\blacksquare$$
 for  $i = 16$  to 79:  $w_i = (w_{i-16} \oplus w_{i-14} \oplus w_{i-8} \oplus w_{i-3})$   $\dashv 1$ 

< □ > < 同 > < 回 > < 回 > < 回 >

## SHA1: Preprocess Pass

Extend the message block into 80 words
words 0 to 15 are just copied over
for i = 16 to 79: w<sub>i</sub> = (w<sub>i-16</sub> ⊕ w<sub>i-14</sub> ⊕ w<sub>i-8</sub> ⊕ w<sub>i-3</sub>) <sup>4</sup> 1
Group these 80 words into 4 sets, each containing 20 words

 $w_0 - w_{19}, w_{20} - w_{39}, w_{40} - w_{59}, w_{60} - w_{79}$ 

< □ > < □ > < □ > < □ > < □ > < □ >

# SHA1: Digest Pass

- Each pass updates the digest using 20 words,  $w_0$  to  $w_{19}$
- Assume p is the pass number (0, 1, 2, 3), then for i = 0 to 19:  $A' = E + (A \uparrow 5) + w_i + K_p + f_p(B, C, D)$ B' = A $C' = B \uparrow 30$ D' = CE' = D $K_p$  is a constant,  $f_p$  is a function (both vary wrt. p)

# SHA1: Digest Pass

• Why MD5 and SHA1 is much faster than DES?

| Digest Pass | SHA-1   | MD5                                   |
|-------------|---|---------------------------------------|
| 1           | $(B \wedge C) \lor (\sim B \wedge D)$           | $(x \wedge y) \vee (\sim x \wedge z)$ |
| 2           | $B\oplus C\oplus D$                             | $(x \wedge z) \vee (y \wedge \sim z)$ |
| 3           | $(B \land C) \lor (B \land D) \lor (C \land D)$ | $x \oplus y \oplus z$                 |
| 4           | $B\oplus C\oplus D$                             | $y \oplus (x \lor \sim z)$            |

## Conclusion

#### Bruce Schneier:

"Hash functions are the least-well-understood cryptographic primitive, and hashing techniques are much less developed than encryption techniques."
