Chapter 13: I/O Systems

- I/O Hardware
- Application I/O Interface
- Kernel I/O Subsystem
- Transforming I/O Requests to Hardware Operations
- Streams
- Performance
Objectives

- Explore the structure of an operating system’s I/O subsystem
- Discuss the principles of I/O hardware and its complexity
- Provide details of the performance aspects of I/O hardware and software
I/O Hardware

- Incredible variety of I/O devices
- Common concepts
  - Port
  - **Bus** (*daisy chain* or shared direct access)
  - **Controller** (*host adapter*)
- I/O instructions control devices
- Devices have addresses, used by
  - Direct I/O instructions
  - **Memory-mapped** I/O
A Typical PC Bus Structure
## Device I/O Port Locations on PCs (partial)

<table>
<thead>
<tr>
<th>I/O address range (hexadecimal)</th>
<th>device</th>

</tbody>
</table>
Polling

- Determines state of device
  - command-ready
  - busy
  - Error
- **Busy-wait** cycle to wait for I/O from device
Interrupts

- CPU **Interrupt-request line** triggered by I/O device
- **Interrupt handler** receives interrupts
- **Maskable** to ignore or delay some interrupts
- Interrupt vector to dispatch interrupt to correct handler
  - Based on priority
  - Some **nonmaskable**
- Interrupt mechanism also used for exceptions
Interrupt-Driven I/O Cycle

1. CPU
   - device driver initiates I/O
   - CPU executing checks for interrupts between instructions
   - CPU receiving interrupt, transfers control to interrupt handler
     - interrupt handler processes data, returns from interrupt
     - CPU resumes processing of interrupted task
   - input ready, output complete, or error generates interrupt signal

2. I/O controller
   - initiates I/O
## Intel Pentium Processor Event-Vector Table

<td>32–255</td>
<td>maskable interrupts</td>
</tr>
</tbody>
</table>
Direct Memory Access

- Used to avoid **programmed I/O** for large data movement
- Requires **DMA** controller
- Bypasses CPU to transfer data directly between I/O device and memory
Six Step Process to Perform DMA Transfer

1. device driver is told to transfer disk data to buffer at address X
2. device driver tells disk controller to transfer C bytes from disk to buffer at address X
3. disk controller initiates DMA transfer
4. disk controller sends each byte to DMA controller
5. DMA controller transfers bytes to buffer X, increasing memory address and decreasing C until C = 0
6. when C = 0, DMA interrupts CPU to signal transfer completion
Application I/O Interface

- I/O system calls encapsulate device behaviors in generic classes
- Device-driver layer hides differences among I/O controllers from kernel
- Devices vary in many dimensions
  - Character-stream or block
  - Sequential or random-access
  - Sharable or dedicated
  - Speed of operation
  - read-write, read only, or write only
A Kernel I/O Structure

- **Kernel I/O Subsystem**
  - **Software**
    - SCSI device driver
    - keyboard device driver
    - mouse device driver
    - ... (Repeating)
    - PCI bus device driver
    - floppy device driver
    - ATAPI device driver
  - **Hardware**
    - SCSI device controller
    - keyboard device controller
    - mouse device controller
    - ... (Repeating)
    - PCI bus device controller
    - floppy device controller
    - ATAPI device controller
    - SCSI devices
    - keyboard
    - mouse
    - ... (Repeating)
    - PCI bus
    - floppy-disk drives
    - ATAPI devices (disks, tapes, drives)
## Characteristics of I/O Devices

<table>
<thead>
<tr>
<th>aspect</th>
<th>variation</th>
<th>example</th>
</tr>
</thead>
<tbody>
<tr>
<td>data-transfer mode</td>
<td>character block</td>
<td>terminal disk</td>
</tr>
<tr>
<td>access method</td>
<td>sequential random</td>
<td>modem CD-ROM</td>
</tr>
<tr>
<td>transfer schedule</td>
<td>synchronous asynchronous</td>
<td>tape keyboard</td>
</tr>
<tr>
<td>sharing</td>
<td>dedicated sharable</td>
<td>tape keyboard</td>
</tr>
<tr>
<td>device speed</td>
<td>latency seek time transfer rate delay between operations</td>
<td></td>
</tr>
<tr>
<td>I/O direction</td>
<td>read only write only read–write</td>
<td>CD-ROM graphics controller disk</td>
</tr>
</tbody>
</table>
Block and Character Devices

- **Block devices include disk drives**
  - Commands include read, write, seek
  - Raw I/O or file-system access
  - Memory-mapped file access possible

- **Character devices include keyboards, mice, serial ports**
  - Commands include `get`, `put`
  - Libraries layered on top allow line editing
Network Devices

- Varying enough from block and character to have own interface

- Unix and Windows NT/9x/2000 include socket interface
  - Separates network protocol from network operation
  - Includes `select` functionality

- Approaches vary widely (pipes, FIFOs, streams, queues, mailboxes)
Clocks and Timers

- Provide current time, elapsed time, timer
- **Programmable interval timer** used for timings, periodic interrupts
- `ioctl` (on UNIX) covers odd aspects of I/O such as clocks and timers
Blocking and Nonblocking I/O

- **Blocking** - process suspended until I/O completed
  - Easy to use and understand
  - Insufficient for some needs

- **Nonblocking** - I/O call returns as much as available
  - User interface, data copy (buffered I/O)
  - Implemented via multi-threading
  - Returns quickly with count of bytes read or written

- **Asynchronous** - process runs while I/O executes
  - Difficult to use
  - I/O subsystem signals process when I/O completed
Two I/O Methods

(a) Synchronous

(b) Asynchronous
Kernel I/O Subsystem

- Scheduling
  - Some I/O request ordering via per-device queue
  - Some OSs try fairness

- Buffering - store data in memory while transferring between devices
  - To cope with device speed mismatch
  - To cope with device transfer size mismatch
  - To maintain “copy semantics”
# Device-status Table

<table>
<thead>
<tr>
<th>Device</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>keyboard</td>
<td>idle</td>
</tr>
<tr>
<td>laser printer</td>
<td>busy</td>
</tr>
<tr>
<td>mouse</td>
<td>idle</td>
</tr>
<tr>
<td>disk unit 1</td>
<td>idle</td>
</tr>
<tr>
<td>disk unit 2</td>
<td>busy</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

- **request for laser printer**
  - address: 38546
  - length: 1372

- **request for disk unit 2**
  - file: xxx
  - operation: read
  - address: 43046
  - length: 20000

- **request for disk unit 2**
  - file: yyy
  - operation: write
  - address: 03458
  - length: 500
Sun Enterprise 6000 Device-Transfer Rates
Kernel I/O Subsystem

- **Caching** - fast memory holding copy of data
  - Always just a copy
  - Key to performance

- **Spooling** - hold output for a device
  - If device can serve only one request at a time
  - i.e., Printing

- **Device reservation** - provides exclusive access to a device
  - System calls for allocation and deallocation
  - Watch out for deadlock
Error Handling

- OS can recover from disk read, device unavailable, transient write failures
- Most return an error number or code when I/O request fails
- System error logs hold problem reports
I/O Protection

- User process may accidentally or purposefully attempt to disrupt normal operation via illegal I/O instructions
  - All I/O instructions defined to be privileged
  - I/O must be performed via system calls
    - Memory-mapped and I/O port memory locations must be protected too
Use of a System Call to Perform I/O

1. trap to monitor
2. perform I/O
3. return to user

system call $n$
Kernel Data Structures

- Kernel keeps state info for I/O components, including open file tables, network connections, character device state

- Many, many complex data structures to track buffers, memory allocation, “dirty” blocks

- Some use object-oriented methods and message passing to implement I/O
UNIX I/O Kernel Structure

- file descriptor
  - user-process memory
  - per-process open-file table
    - system-wide open-file table
      - file-system record
        - inode pointer
        - pointer to read and write functions
        - pointer to select function
        - pointer to ioctl function
        - pointer to close function
      - networking (socket) record
        - pointer to network info
        - pointer to read and write functions
        - pointer to select function
        - pointer to ioctl function
        - pointer to close function

- kernel memory
  - active-inode table
  - network-information table
Consider reading a file from disk for a process:

- Determine device holding file
- Translate name to device representation
- Physically read data from disk into buffer
- Make data available to requesting process
- Return control to process
Life Cycle of An I/O Request

1. **Request I/O**
   - System call
2. **Can already satisfy request?**
   - No: Send request to device driver, block process if appropriate
   - Yes: Kernel I/O subsystem transferred to process, return completion or error code
3. **Transfer data**
   - Device driver
   - Device controller commands
   - Monitor device, interrupt when I/O completed
4. **Determine which I/O completed, indicate state change to I/O subsystem**
5. **Receive interrupt, store data in device-driver buffer if input, signal to unblock device driver**
6. **I/O completed, generate interrupt**

*Time*
STREAMS

- **STREAM** – a full-duplex communication channel between a user-level process and a device in Unix System V and beyond

- A STREAM consists of:
  - STREAM head interfaces with the user process
  - driver end interfaces with the device
  - zero or more STREAM modules between them.

- Each module contains a **read queue** and a **write queue**

- Message passing is used to communicate between queues
The STREAMS Structure

user process

stream head
read queue | write queue

read queue | write queue

read queue | write queue

read queue | write queue

driver end

device

modules
Performance

- I/O a major factor in system performance:
  - Demands CPU to execute device driver, kernel I/O code
  - Context switches due to interrupts
  - Data copying
  - Network traffic especially stressful
Intercomputer Communications
Improving Performance

- Reduce number of context switches
- Reduce data copying
- Reduce interrupts by using large transfers, smart controllers, polling
- Use DMA
- Balance CPU, memory, bus, and I/O performance for highest throughput
Device-Functionality Progression
