
Project 3:

An Introduction to File Systems

COP 4610 / CGS 5765

Principles of Operating Systems

Introduction

- Project 3 learning objectives
 - File system design and implementation
 - File system testing
 - Data serialization/de-serialization

Project 3 Expectations

- Teams of **2**
 - Partner is **required**
- Program executes in user-space, not kernel
- Source code
 - C/C++ only
 - Standard C/C++ libraries only

Project 3 Expectations

- Testing environment for grading
 - MCH 202 lab machines
 - You may develop on another machine just make sure your program works on the machines in the lab
- May require a demo

OVERVIEW

Typical Goals of File System Design

- Means for users (e.g., apps) to access data
 - Store data
 - Locate and retrieve data
- Uses persistent media (e.g., SSD, hard disks)
- Consistency (e.g., after power failure)
- Good performance

Persistent Storage

- Typically accessed as 1-dimensional array of data units

Design Questions

- How best to use persistent storage?
- Where to store data
 - Fragmentation
 - Performance
 - What abstract data structure to use?
 - Timing characteristics of storage device
- Additional information (metadata)
 - User
 - E.g., name of file, date stamps
 - Filesystem
 - E.g., pointers to locate specific data, journal
- Other considerations
 - Guarantees to user
 - E.g., data recoverable when file closed
 - Media corruption/failure
 - E.g., duplication

REAL-WORLD EXAMPLE

Running out of storage space?

- At least 64MB free plus space for your source code
- To see how much storage space you have remaining, issue the following command:

```
$> df -h
```

df -h

A terminal window titled 'user@cop4610: ~' with standard window controls. The terminal shows the command 'df -h' and its output. The output is a table with columns: Filesystem, Size, Used, Avail, Use%, and Mounted on. The first row shows '/dev/sda1' with a size of 7.5G, 5.0G used, 2.2G available, 70% usage, and mounted at '/'. The next three rows show 'tmpfs' for '/lib/init/rw', '/dev', and '/dev/shm', all with sizes of 1014M and 0% usage.

```
user@cop4610:~$ df -h
Filesystem      Size  Used Avail Use% Mounted on
/dev/sda1       7.5G  5.0G  2.2G  70% /
tmpfs           1014M    0 1014M   0% /lib/init/rw
udev            10M    644K  9.4M   7% /dev
tmpfs           1014M    0 1014M   0% /dev/shm
user@cop4610:~$
```

- **/dev/sda1**
 - ❑ root file system (mounted at “/”)
 - ❑ 2.2GB currently available

MOUNTING FILE SYSTEMS

Unix File Hierarchy

- All files accessible in a UNIX system are arranged in one big tree
 - Also called the ***file hierarchy***
 - Tree is rooted (starts) at */*
- Files may be spread across several devices
- The **mount** utility serves to attach a filesystem to the file hierarchy
 - E.g., mount filesystem on usb device

'mount' utility

- mount
 - mount <device> <mount directory>
- 'mount' without arguments
 - What device (e.g., partition) is mounted and where
 - Second example attaches a device or partition to a directory
 - May require root privileges

Mount Example

The device sda partition 1 is mounted at “/”. All files and dirs below “/” come from this device.

Mount Example

- Type command 'mount' without any arguments to see what is mounted and where

```
user@cop4610: ~  
user@cop4610:~$ mount  
/dev/sda1 on / type ext3 (rw,errors=remount-ro)  
tmpfs on /lib/init/rw type tmpfs (rw,nosuid,mode=0755)  
proc on /proc type proc (rw,noexec,nosuid,nodev)  
sysfs on /sys type sysfs (rw,noexec,nosuid,nodev)  
procbususb on /proc/bus/usb type usbfs (rw)  
udev on /dev type tmpfs (rw,mode=0755)  
tmpfs on /dev/shm type tmpfs (rw,nosuid,nodev)  
devpts on /dev/pts type devpts (rw,noexec,nosuid,gid=5,mode=620)  
user@cop4610:~$
```

Root "/" file
system
mounted

Mount Example

Now suppose we want our thumb drive files accessible under `/mnt...`

File Hierarchy Example

Mount Example

- The 'mount' utility dynamically attaches filesystems to the existing hierarchy

A terminal window titled 'user@cop4610: ~' with standard window controls (minimize, maximize, close). The terminal shows the following commands and output:

```
user@cop4610:~$ sudo mount /dev/sdb1 /mnt
[sudo] password for user:
user@cop4610:~$ mount
/dev/sda1 on / type ext3 (rw,errors=remount-ro)
tmpfs on /lib/init/rw type tmpfs (rw,nosuid,mode=0755)
proc on /proc type proc (rw,noexec,nosuid,nodev)
sysfs on /sys type sysfs (rw,noexec,nosuid,nodev)
procbususb on /proc/bus/usb type usbfs (rw)
udev on /dev type tmpfs (rw,mode=0755)
tmpfs on /dev/shm type tmpfs (rw,nosuid,nodev)
devpts on /dev/pts type devpts (rw,noexec,nosuid,gid=5,mode=620)
/dev/sdb1 on /mnt type vfat (rw)
user@cop4610:~$
```

Mount Example

- The 'mount' command can dynamically attach new devices to new mount points

```
user@cop4610: ~  
user@cop4610:~$ sudo mount /dev/sdb1 /mnt  
[sudo] password for user:  
user@cop4610:~$ mount  
/dev/sda1 on / type ext3 (rw,errors=remount-ro)  
tmpfs on /lib/init/rw type tmpfs (rw,nosuid,mode=0755)  
proc on /proc type proc (rw,noexec,nosuid,nodev)  
sysfs on /sys type sysfs (rw,noexec,nosuid,nodev)  
procbususb on /proc/bus/usb type usbfs (rw)  
udev on /dev type tmpfs (rw,mode=0755)  
tmpfs on /dev/shm type tmpfs (rw,nosuid,nodev)  
devpts on /dev/pts type devpts (rw,noexec,nosuid,gid=5,mode=0600)  
/dev/sdb1 on /mnt type vfat (rw)  
user@cop4610:~$
```

Thumb drive
mounted
here

Unmounting

- `umount <dir>`

- In our example, the thumb drive was mounted at `/mnt`, to unmount
 - `$> umount /mnt`
 - May require root privileges

System Configuration

- **/etc/fstab**
 - List of filesystems and mount locations
 - Mounting options
 - auto-mount during boot
 - read-only
 - ...
- View output of **dmesg** when plugging in device

Project 3

- You will create a user-space utility to manipulate a FAT32 file system image
 - No more kernel programming!
- Utility must provide a few basic operations on a given FAT32 filesystem
 - Must not corrupt the filesystem (i.e., deviate from the specifications)

FAT32 Manipulation Utility

Utility only recognizes the following built-in commands:

- open
- close
- create
- rm
- size
- fsinfo
- cd
- ls
- mkdir
- rmdir
- read
- write

File System Image

- Manipulation utility will work on a pre-configured FAT32 ***file system image***
- Raw FAT32 data structures
 - Just like looking at the raw bytes of a disk partition

File System Image

- Your FAT32 manipulation utility will have to
 - Open the FAT32 file system image
 - Read parts of the FAT32 file system image and interpret the raw bytes inside to service your utility's file system commands...

...just like a file system!

File System Image

- Sometimes you may want to check that you haven't corrupted your file system image, or that you can add or write files successfully
 - Mount your file system image with the OS FAT32 driver
 - Just like the file system image is a device

File System Image Mount Example

File System Image Mount Example

File System Image Mount Example

File System Image Mount Example

```
$> sudo mount -o loop fat32.img /mnt  
$> cd /mnt
```

- `fat32.img` is your image file
- `/mnt` is your mounting directory
- Once the file is mounted, you can go into the `/mnt` directory and issue all your normal file system commands like:
 - `ls`, `cat`, `cd`, ...

FAT32 DATA STRUCTURES

Terminology

- Byte
 - ❑ 8 bits
 - ❑ Smallest addressable unit of processor
- Sector
 - ❑ Smallest addressable unit of persistent storage device
 - ❑ Typically 512 or 4096 bytes
- Cluster
 - ❑ Group of sectors representing a chunk of data
 - ❑ FAT32-specific
- FAT
 - ❑ File Allocation Table
 - ❑ Mapping of files to data

FAT32 Disk Layout

- 3 main regions...

Reserved Region

- **Reserved Region** – Includes the boot sector, the extended boot sector, the file system information sector, and a other reserved sectors

FAT Region

- **FAT Region** – A map used to traverse the data region. Contains mappings from cluster locations to cluster locations

Data Region

- **Data Region** – Using the addresses from the FAT region, contains actual file/directory data

Endian

Big or little?

Endianness

- Order to interpret a 1-dimensional array of bytes to form a larger data structure
 - E.g., ints, shorts, long longs
- Big-endian
 - Most significant byte first
 - *Big end first*
- Little-endian
 - Least significant byte first
 - *Little end first*
- FAT32 is assumes little-endian formatting

Endianness

- Order to interpret a 1-dimensional array of bytes to form a larger data structure
 - ❑ E.g., ints, shorts, long longs
- Big-endian
 - ❑ Most significant byte first
 - ❑ Big end first
- Little-endian
 - ❑ Least significant byte first
 - ❑ Little end first
- FAT32 is assumes little-endian formatting

FAT32 Endianness

- Endianness matters in your project
 - Integral values in FAT32 image
 - E.g., short
 - Directory entry attributes

Endianness Example

- Imagine you can only communicate three letters at a time, and your word is “RAPID”
- Big-endian
 - ❑ 1. RAP
 - ❑ 2. ID
 - ❑ Word = RAPID
- Little-endian
 - ❑ 1. PID
 - ❑ 2. RA
 - ❑ Word = PIDRA (come again?)

Endianness Example

- `short value = 15; /* 0x000F */`
- `char bytes[2];`
- `memcpy(bytes, &value, sizeof(short));`
- In little-endian:
 - `bytes[0] = 0x0F`
 - `bytes[1] = 0x00`
- In big-endian:
 - `bytes[0] = 0x00`
 - `bytes[1] = 0x0F`

Endian Example

- `int value = 13371337; /* 0x00CC07C9 */`
- `char bytes[4];`
- `memcpy(bytes, &value, sizeof(int));`
- In little-endian:
 - ❑ `bytes[0] = 0xC9`
 - ❑ `bytes[1] = 0x07`
 - ❑ `bytes[2] = 0xCC`
 - ❑ `bytes[3] = 0x00`
- In big-endian:
 - ❑ `bytes[0] = 0x00`
 - ❑ `bytes[1] = 0xCC`
 - ❑ `bytes[2] = 0x07`
 - ❑ `bytes[3] = 0x09`

Value = 13,371,337
(0x 00 CC 07 C9)

index	0	1	2	3
little endian	0xC9	0x07	0xCC	0x00
big endian	0x00	0xCC	0x07	0xC9

Until Next Time

- Set up your environment
- Download the image file
- Mount the image file with the default OS FAT32 drivers
 - Make sure you can cd into /mnt and read/write to the files
- Read over the FAT32 Specification
