

Programming 1 - Sample Milestone Assignment 1 Questions

Milestone 1 on 02/18/2022, in-class

Released: February 11, 2022

The Milestone Assignment consists of

1. 10 multiple choice questions - 30 points
2. 15 single line response questions - 45 points
3. 1 code writing question - 25 points
4. 3 short answer questions - 15 points

General details:

- **The Milestone Assignment will be on paper, in-class**
- The milestone assignment can be solved in about 50 minutes.
- The milestone assignment is supposed to be individual work. You will be asked to sign an Honor Code statement.
- The Milestone Assignment is closed-book, closed-notes. You are **NOT** allowed to use any electronic devices, including graphing calculators. The instructional staff will have 45 4-function calculators on hand and you may borrow those if required.
- You will have an opportunity to earn 15 extra credit points.
- The milestone assignment will examine your understanding of the material rather than your capacity to memorize copious amounts of information.
- Please try and attempt all questions. You get points for trying.
- Anything from the homeworks / quizzes / in class examples / exercises / slides is fair game. You don't need to look for more material.
- The single line response questions will be mainly code comprehension and syntax based. You will be asked for the output of a small code snippet or to fix an error in a code snippet.
- The code writing questions will be heavily based on the homeworks and class examples and exercises, with some modifications.
- The multiple choice and the short answer questions will test your familiarity with the C++ language and syntax. The code writing questions will test your knowledge of programming.
- **For Problem 2, you would need to explain your answer. Just writing out your output/fix will only get you partial credit.** However, your explanation doesn't have to be longer than about 10 words.
- **For Problem 3, you will be graded based on**
 - Whether your code works

- Are you using the required concepts?
- Are you adhering to standard programming practices?
- IT IS MORE THAN JUST AN OUTPUT MATCHING PROBLEM
- **Solutions to the short answer questions must be SHORT and to the point. A 6 paragraph essay when 4 lines would do means your answer will just be skimmed through in the interest of grading time (The needs of the many ...)**
- You will also receive a Canvas announcement about the milestone assignment with these details on Thursday, 02/10/2022.
- **General Advice: For the sake of completing the assignment on time, please answer all questions before seeking to verify the answers.**
- Making me laugh might gain you points (depends on the quality of the joke).

Topics to study

- Basic C++ Syntax
 - Writing a basic C++ program stub: including required libraries, adding namespaces and writing the main function.
 - Simple statements - syntax.
 - Comments.
 - Reserved words, literals and escape sequences.
 - Style guidelines.
- Data types, variables, and sequential execution.
 - Naming, declaring and initializing variables.
 - Primitive data types.
 - Type Conversions - implicit and explicit.
 - Arithmetic Operators and operator precedence.
- I/O - printing and reading values from the user.
 - cout statements - printing literals and variables.
 - Precision for floating point variables.
 - Using cin to read data of different kinds.
- Selection statements and loops
 - Relational and logical operators.
 - Writing simple, multiple and nested if statements.
 - switch - case statements.
 - while, do-while and for loops
 - break and continue statements.
 - Overflow and Underflow
 - Scope of variable
- Studying the topics listed above will be enough to pass the test. To get a 100, you would be required to study everything on the notes.
- You don't need to study from outside sources. The test is made entirely from the notes, class examples, exercises, quizzes and assignments.

Sample Questions

1. Which of the following is NOT a C++ reserved word?

- (a) switch
- (b) continue
- (c) char
- (d) main

Answer: main

2. Evaluate the following expression. $x = 5, y = 15, z = 3$ (All integers)
 $x * 4 + y / 2 \% z$ Answer: 21. Operator precedence (*, /, %, + and integer division).

3. A C++ variable can begin with

- (a) A letter
- (b) underscore
- (c) '\$' sign
- (d) All of the above

Answer: All of the above

4. Write a program to calculate the sum of all the multiples of 3 between 1 and 200.

Sample Run:

The sum is : 6633

```
#include<iostream>
using namespace std;
int main()
{
    int sum =0;
    for(int i=3; i<200; i+=3)
        sum+=i;
    cout<<"The sum is : "<<sum<<endl;
    return 0;
}
```

5. Write a C++ program to read in a series of numbers from the user. Stop when the user enters 0. Print the sum of the square roots of the numbers. If the number is negative, consider its absolute value.

Sample Run:

Enter the numbers:

15

-20

123

-5

0

The sum is 21.6717

```

#include<iostream>
#include<cmath>
using namespace std;
int main()
{
    double num, sum=0;
    cout<<"Enter the numbers: "<<endl;
    cin>>num;
    while(num != 0)
    {
        sum = sum + sqrt(num);
        cin>>num;
    }
    cout<<"The sum is "<<sum<<endl;
    return 0;
}

```

6. Write a C++ program that reads an integer 'N'. Then, read in 'N' numbers from the user and print the sum of all the odd numbers

Sample Run:

```

Enter the number of inputs: 10
Enter 10 numbers:
2 13 -5 9 34 8 10 -11 15 6
The sum of the odd numbers is 21

```

```

#include<iostream>
using namespace std;
int main()
{
    int N,count=1,sum = 0,val;
    cout<<"Enter the number of inputs: ";
    cin>>N;
    cout<<"Enter "<<N<<" numbers: "<<endl;
    while(count<=N)
    {
        cin>>val;
        if(val%2 == 1)
            sum+=val;
        count++;
    }
    cout<<"The sum of the odd numbers is "<<sum<<endl;
}

```

7. Figure out the output generated by the following code snippet:

```

int score = 93;
char grade;

if (score >= 90)
    cout<< 'A';
if (score >= 80)
    cout<< 'B';

```

Answer: AB

Both conditions are satisfied, there is no “else”.

8. What is the difference between the while and do-while loops?

Answer: The do-while loop checks the condition after doing the task, so it runs at least once before checking the condition. The while loop checks the condition first, so it runs the loop at least 0 times. The do-while loop also needs a semi-colon and the curly brackets.

9. Examine the following code snippet and pick out the syntax error (2 examples here)

```
for(int r=0, r<size; r++)
{
    cout >> r ;
}
```

Answer:

- (a) Missing semicolon on the last cout
- (b) cout needs <<not >>(in the inner for)

1 How to actually take the Milestone Assignment

This is a suggested method for tackling the milestone assignment and the key to completing it on time. Please note the emphasis on testing of your understanding of the material - programming is a process, so we’re testing your understanding of the processes involved to accomplish the task using the tools you’ve learned, not your memorization skills.

1.1 Before the assignment

Practice is the only way to get better at programming. Please solve the practice problems. And then try to solve variations of the practice problems. For example, if the practice problem asked you to find the largest number, also try and find the smallest. If the practice problem asks you to run a loop forwards, also try running it backwards.

Similarly work through the class examples and homeworks. The problems on the test are heavily based on class examples, homework problems or practice problems.

If you have questions, ask during help sessions or after class. Help Sessions are not just for homework help. They’re a vital resource when you don’t have regular in-person contact with your instructor or TA/LA.

1.2 During the assignment

TIME YOURSELF

Also, scratch paper and pencils are your best friends.

- 1 minute per multiple choice question - you either know it or can deduce it within a minute. Otherwise, just put down an answer and mark the question as a “review later” on your scratch paper.
- 1 minute per single sentence response. The “explanation” part can be short, and sentence structure and grammar are useful, but not vital.

- 10 minutes for the code writing problem. Turn in what you have. There is a lot of partial credit.

For this problem, you don't need to do error checking. You only need to solve the specific problem, assuming everything else goes well.

- 4 minutes per short answer question - Here, we're interested in what you know about the concept.
- This would leave you with 3-5 minutes to finish up any unfinished problem.
- The objective of the test is not to be 100% right. It mimics the programming interview, where a "quick, gut instinct" solution is good enough for the first part of the process - your initial thoughts - that demonstrates your level of knowledge and understanding of programming.
